1880.
Harper's Magazine.
ILLUSTRATED.
"Studying the subject objectively and from the educational point of view—seeking to provide that which taken altogether, will be of the most service to the largest number—I long ago concluded that, if I could have but one work for a public library, I would collect a complete set of *Harper's Monthly*."—CHARLES FRANCIS ADAMS, Jr.
Its contents are contributed by the most eminent authors and artists of Europe and America, while the long experience of its publishers has made them thoroughly conversant with the desires of the public which they will spare no effort to gratify.
The volumes of the *Magazine* begin with the numbers for June and December of each year. When no time is specified, it will be understood that the subscriber wishes to begin with the current number.

HARPER'S PERIODICALS.

1880.
HARPER'S YOUNG PEOPLE.
ILLUSTRATED.
The evils of sensational literature for the young are well known, and the want of an antidote has long been felt. This is supplied by HARPER'S YOUNG PEOPLE, a beautifully illustrated weekly journal, which is equally devoid of the objectionable features of sensational juvenile literature and of that moralizing tone which repels the youthful reader.
The Volumes of the *Young People* begin with the first Number, published in November of each year. When no time is mentioned, it will be understood that the subscriber wishes to commence with the Number next after the receipt of order.

A CLOSE SHAVE.

"Another step and you are a dead man."

"By what authority do you bar my passage?"

"Authority? Ha, ha! If this ain't enough," holding out a revolver in each hand, with a hideous leer in his evil face, "I reckon I'll have to explain further. By the authority of the Road Agency of this great overland route."

It was in the days when Ben. Holladay and the pony express served in lieu of locomotives and telegraph lines. When might was right throughout a region extending over nineteen hundred miles, from St. Joseph to Sacramento; when the stage ran the gauntlet of road agents and Indians, and bones, many of them human remains, grimmed up at the traveller unexpectedly, as he crossed the plains; when to be "quick on trigger" was worth more to a man than all the wealth, all the culture, and all the courage in the world.

Dick Hartford looked into the man's face calmly, looked into the muzzles of the pistols, smiled, and uttered a single word: "Well?"

"Don't you aggravate me, or I will fire, and serve you right."

"I never flinched in my life. I won't flinch now. What do you want?"

"Throw down your revolver. Now turn round, and if you budge a hair's breadth, I'll blow your brains out."

Hartford obeyed. He permitted his hands to be tied behind his back. He saw his pockets turned inside out, his money appropriated, his watch pocketed, and only remonstrated when his captor felt for a money belt. "Don't cut me, there's no belt on me."

"O! you did feel it, then. Thought I had a bank to pry open. Now then, march. There's good ground here, and plenty of it. It will do you good to stretch your legs. Keep right on to the clump to the left, and mind you, don't stumble, for like as not you'll never get up. There was one fellow stumbled here about six weeks ago, and he never got higher than his knees. I'll show you his bones d'reckly."

Was it a lie, or a threat? Hartford cursed himself for refusing to listen to the advice of the conductor of the stage who warned him to beware of the road agents. He had answered that he would take the risk. He desired to see for himself if the stories told of the robberies and murders on the route were true. And he was learning.

"A little faster, stranger. My horse is reether restive, and, beside, Sim Porter would like to see you."

The road was unbroken, but the dust was stifling, and it blew from the horse's feet to the captive. The captive kept his head up, and strode on.

"Rough, isn't it? Now, I suspect you came out to capture some one. Like as not, Jim Porter?"

No response from the captive.

"They do say there is a party looking for us. Porter is anxious to see them. This yer's a God-send. Never thought to meet ye this way. Got tired riflin', I suppose. Thought you'd lay over, do up a little business, and take next stage. Now, I never knew a man to lay over that didn't rue it. There was a man from Illinoy laid over about three months ago. Had some instruction. He was mighty sly, that Illinoyan. I reckon he'd furnish a regiment of Vigilants with cunning. Kind o' sauntered out of the same town you left an hour ago, but he had some company. He wasn't such a fool as you. And his company went back on him. Shot him through the spine, then tickled his ribs with a knife. He was a powerful, active Vigilante, was the company. He was too much for the Illinoyan."

"Just as you were too much for me."

"I like your pluck, now. You do keep a stiff upper lip. But it's all day with you the moment Porter claps eyes on you. He makes short work of spies. I reckon that's your line."

The captive did not reply. At that moment his thoughts were on home. A mighty throb rose in his throat—a suffocating throb—wrenched from him by that one thought of home. His wife and child, his boy that he would never see again. It was hard. He had played a bold game, and he had lost. The Vigilantes were in league with the road agents. He had been outwitted. The stage company would be short another man, and the road would be under tribute as before. His plans, so carefully concealed in his own breast, were known to the murderous gang. Perhaps in less than an hour he would be dangling at the end of a rope. He half turned, as he thought of the end.

"None o' that, unless you want your early pill, in which case I'm bound to accommodate ye. Porter didn't say we were to run risks. He does like a friendly chat, and he pumps some people as dry as lime-kiln."

"I'll make you an offer,"

"Crack your whip."

"I'll fight you fair, like a man. Tie one arm down, give me a pistol, and let us take shot about, you the first."

"Sho', now."

"Or, I'll allow you two to one."

"Yes, I see you can allow most anything, but unless you move right on, and keep movin', I'll make short work of ye."

A cayote rose slowly from a sage brush, looked at them sneakingly over his shoulder, then trotted slowly away. A noisome bird of prey rose slowly from the carcass of a mule, flapped its wings lazily, sailed slowly through the air, then settled down upon a rib that protruded from the sand.

The sun's rays poured down upon the plain, until the dust and sand seemed to melt in the fervid heat. And to crown all, the captive suddenly experienced the agony of excessive thirst.

A faint sound in the distance arrested his attention. Was that not the sound of horses' feet? What if it should be his friends the Vigilantes? Impossible. His morning stroll was unknown to them. The sound came near to him. Then he observed for the first time a rocky defile further to the left, as though a chasm lay there, or chiseled out its course across the plains. Now there could be no mistaking the sound. The steady trot of horses' feet and the clanking of spurs could be heard. Suddenly half a dozen horsemen swept around a low rock, at sight of whom the captor grunted.

"Here's Captain Jim. Mind your manners now, for he is the perfitest man I ever met."

The captive shivered. When a boy, he was detected in an act that brought upon him the wrath of the teacher of the school in the New England village he would never see more. The eagle eye of the teacher signaled him out from a score of mischief makers, and he shivered as he felt that the punishment awarded incorrigibles was unavoidable. But he braced himself, walked out promptly to the middle of the floor, the moment his name was called, and to his lasting surprise, was let go with a mild rebuke. In much the same manner, Dick Hartford braced himself for the interview with the leader of the most desperate gang of miscreants that ever levied a tax upon the travelers who crossed the plains. This was the man he had dreamed of circumventing. The case was reversed.

The road agents rode forward without order, and surrounded the horseman and captive.

"What have you got, Barham?"

"Make your bow. It's Captain Jim," said Barham. Then to Captain Jim's query: "That is for you to find out. I obeyed orders."

What a magnificent front the captive presented. His gaze was as clear and steady and levee as though he were looking right through Captain Jim, away beyond the ranch, and off to the mountains in the distance.

"What have you got to say for yourself, anyhow?" Captain Jim's sinister face clouded still more as he met the unwavering gaze of the captive.

"Nothing," replied the captive, as he walked in front of the leader.

"You are locked up, and the keys are lost," said Captain Jim, sneeringly. "I think I know your business. I've a mind to send Ben Holladay your ears. No, I'll send him your heart. This trip is a failure, and Ben ought to know it. If you won't talk—"

"I'll die first!" The words were flung at him so passionately that even Captain Jim was moved to admiration.

"Die it is, then!" exclaimed one of the gang.

"You are seven to one," said Hartford.

"We are in the majority mostly," said Jim. But I'll give you a chance. You are plucky. Now, what does a milk-shop do for you? Come along with us, share and share alike, and we'll give you excitement, and opportunity to show the stuff you are made of."

"To make one of a gang of murderers, who are afraid to cope man to man," said the captive.

One of the gang at that moment levelled his pistol at Hartford's head. But the leader ordered him to keep his fire, until there was need for it. "Let us do this thing in order," said Captain Jim, as the scar on his cheek became livid, then a dull red. "We'll ride down to the old place, and pull him up like a dog. You got what was on him?" to Barham. Barham nodded. There was not a word said further. The party rode on perhaps twenty minutes, when the defile deepened, narrowed, and the rocks shut over the horsemen's heads. Then, at a word from Jim, the men dismounted. Advancing to Hartford, he said, with a cruel smile:

"Say your prayers, you have got five minutes to live. Mount that stone." There was a ledge above the captive's head, with a jutting point, over which a rope was thrown, and a noose made at the end of it.

"Will you allow me to speak?"

"Blow away," answered Captain Jim.

"I may as well tell you we know all about you. You've traveled fifteen hundred miles to trap us. Ben Holladay tried that game often. You gave yourself away. You expected to master the road, and the biggest booby among us mastered you. Now, fire away."

"Well, then, let me predict what your end will be," said the captive. With the noose around his neck, and gloating eyes and fierce faces for his audience, he spoke out clearly, defiantly: "When you've murdered me, you may prepare for the hereafter. There will be no rest for you. A man will come after me, who will hunt you down like the cowardly dogs you are. He will never rest until you are out of the country, and his reach will sweep to California. Once he marks a man that man's fate is sealed. He is not my friend. He knows my mission, and, if it fails, he will shoot every man down with his own hand whom he suspects of knowing anything about me, or my death. That is all. I'm ready now."

"What's that!" exclaimed one of the gang, listening.

"Up with him!" The rope tightened around Hartford's throat, he felt himself strangling, the color faded out, he was in a void, then shooting pains pierced his temple, myriad sparks played before his eyes, blended into brilliant colors, and still he could hear the voice of Captain Jim. Now it was a stream of oaths, an exclamation, "The Vigilantes are upon us!" a blurring of sounds, as he swam, or rather floated, out upon the great void, and then all was over.

It was true. A cloud of dust rolled up from Overland City, swept down towards the narrow defile from the rear, and sent a shiver of fear through the road agents, who scrambled hastily to their saddles, and galloped off in the opposite direction. All but one, Captain Jim, who deliberately approached Hartford as he lay on the ground where he fell when the crowd dropped the rope, and placing a revolver against his temple, pulled the trigger. The pistol snapped fire, and Captain Jim rode off, turning in his saddle and aiming a second time at the apparently lifeless body of the prisoner, and shot him in the arm.

But it would have been better for Captain Jim had he never met the prisoner. For another party, also Vigilantes, armed to the teeth and superbly mounted, encountered the road agents as they emerged from the defile and although the latter put their steeds to the gallop, urging them on with oaths and spurs, the Vigilantes surrounded them with lightning-like swiftness, and standing up in their saddles, or dropping from their horses, necks. Captain Jim proved the most cowardly of the lot. He begged for quarter, but for an answer, was riddled by a dozen bullets.

When the fray was over, and Dick Hartford sat upright, listening to the account of the fight, and of the severest and sharpest the Vigilantes ever experienced, he was complimented upon his courage, and, in turn, thanked his rescuers. In reality, he had performed his mission, but not in the manner he had planned. That he did not succeed in carrying out his plans, was owing to the merest accident. The Vigilantes had been summoned at his instance, and were in time to save his life. "A close shave," as Bris Martin, the captain, remarked. "However, a miss is as good as a mile."

LIVING AND DEAD WORLDS.

Prof. Proctor's Lecture on the Age of the Universe.

Prof. Richard A. Proctor recently lectured in New York on the vastness of time. His audience was very large and attentive, and their interest was proved by the applause with which the lecturer was at times interrupted. Before entering upon the subject of the lecture, Prof. Proctor remarked that his averment, in his lecture on the previous evening, that the moon is beyond the domain of the earth, and is more controlled by the sun than by the earth, had apparently raised doubts in the minds of some persons, and he had received letters requesting further light on the subject. One inquirer asked why, if it is true that the moon is chiefly under the sun's influence instead of the earth's, it (the moon) goes around the earth. The answer is, the lecturer said, that the moon does not go around the earth. The earth and the moon both circle about their common centre of gravity. The moon's path around the sun is very slightly waved owing to the perturbing influence of the earth's attraction, but this variance is so comparatively slight that if the moon's orbit about the sun be represented by a circle three feet in diameter, the variance from a true circle, caused by the earth, would be hardly perceptible.

In considering the vastness of time, as revealed by astronomy, Prof. Proctor began with the earth's geological history. Geologists tell us, basing their conclusions on what seem to be very trustworthy data, that it has required the earth at least one hundred million years to go through its period of strata formation—that is, through the period during which the crust of rock that forms its outer envelope was being developed. During all that time the sun shone upon the earth giving it light and heat. But geologists go back to a time beyond that even, and tell us that before the earth reached the period when the formation of strata was begun it had been for three hundred and fifty million years cooling down from a temperature of 2,000 degrees centigrade to a temperature of 200 degrees. In all probability, the lecturer said, this estimate is rather in which the moon is now—that is, a condition of planetary decrepitude, if not, in fact, of planetary death.

The lecturer then briefly explained the famous Nebular theory of Laplace. Observation shows that all the planets are moving about the sun in one direction; that the moons of all the planets are moving round their primary in the same direction, and that the planets themselves are turning about their axes in that one direction. There is seemingly an exception to this rule in the case of the moons of Uranus, which seem to go in the opposite direction; but this apparent discrepancy has been explained in a manner which proves that there is really no exception to this universal rule of motion in the solar system. If a man placed on an eminence should observe that a number of objects were moving around him, all in one direction, and that some of the smaller among these objects were moving around larger ones in the same direction, he would be led irresistibly to the conclusion that these objects were carried by some fluid constantly moving in that direction, and containing, here and there, edies which would partake of the same kind of motion. This is what Laplace under than over the truth. Back of this again was a period in the earth's existence, when it was a mere mass of nebulous matter, and how long it remained in that state we have no means of determining. Probably, Prof. Proctor said, we may take five hundred million years as about the age of our earth, counting from the time when it began to assume the form of a planet.

The larger a planet is, assuming its density to be the same, the longer, proportionally, will be the time it takes to pass through these stages. Jupiter, for instance, would require, taking its known density into account, over two thousand million of years to go through the cooling process that the earth passed through in about one-seventh of that time. It follows that, in their development, but not in years, the larger planets are younger than the earth, and she in turn is younger, in the same sense, than those planets that rank below her in size, such as Mercury, Mars, and the moon. According to these calculations the earth, about twenty-five hundred million years hence, will be in the condition conceived had happened in the beginning of the solar system. The matter now forming the sun and planets was then, according to this theory, in a nebulous state, and this nebulous matter, starting in the shape of a huge disk, began to whirl about its centre. As the motion increased and the mass contracted, a ring of matter was thrown off at the outer edge, and this ring in process of time broke up into fragments. After a time these fragments were aggregated into one body, and so the outermost planet was formed. By a similar process each of the inner planets was formed, until finally the vast mass at the centre had gathered into the great ball of the sun, controlling the whole system. Similarly the planets in their partially formed state threw off rings, which, condensing, became satellites. It may have happened that one of the great rings thrown off by the main mass of whirling matter broke up into fragments, that were so widely separated and perhaps so comparatively small in quantity that they never became aggregated into one body, and so the little planetoids that the telescopes of Peters and Watson and some other observers are continually picking up were formed, being the fragments that would have composed a planet had the process of growth in their case not failed.

There is nothing in this theory of Laplace, the lecturer said, that is contrary to what we see in the solar system. But Laplace knew nothing of the great number of meteor systems with which we have since his time become acquainted. The earth gathers in about 10,000 tons of meteoric matter every year, and so she may be said to be growing; but this process of growth, in comparison with the earth's bulk, is very slow. Millions of years ago, however, Prof. Proctor said, it is probable that the number of meteor systems was very much greater than now, and the earth, being in the nebulous state, extended over a great space perhaps filling the whole orbit of the moon, and so sweeping up vast quantities of these meteors. At that time, the lecturer said, we are compelled to believe the development of the planets from this meteoric source formed no small part of their growth. Combining Laplace's nebular theory with this theory of growth by meteoric aggregation, we have a means of explaining how the earth and other planets reached the present stage of their existence. Accordingly, the lecturer said, we may consider that the objects about us, and our bodies themselves, are formed of matter that was once whirling through space, and so in this sense at least the heavens were once our homes.

The stereoptican was then used to show pictures of some of the nebulæ which the telescope reveals, and which seem to show the effect of a whirling motion and the gradual aggregation of solid centres, such as the Laplace theory supposes to have taken place in our system. It seems not improbable that in these nebulæ we behold systems in the act of formation which millions of years hence may be suns and worlds like ours.

Prof. Proctor then suggested what he said is the first explanation offered of the fact that meteoric swarms, which are known to follow in the track of comets, lag behind, and in some cases become scattered over the whole length of their orbits. The explanation offered is that when the earth was in a nebulous state these masses of meteoric matter plunged straight through her substance, and the natural result of the resistance they thus encountered at regular recurring periods would be to delay them, and so cause them to lag behind in their orbital sweep.

After showing a number of pictures to illustrate the difference between the two orders of planets in the solar system, Mercury, Venus, the Earth and Mars representing the order in respect to development, as is shown by their smaller size, and Jupiter, Saturn, Uranus, and Neptune representing the larger, and, in the same sense, younger order, the vast bulk and depth of the cloud envelopes surrounding Jupiter and Saturn were illustrated, and the remarkable similarity between Saturn's rings and the rings of nebulous matter conceived by Laplace to have been formed in the development of the universe was pointed out. In the lecturer's opinion, the rings of Saturn will ultimately be formed into satellites like the eight that he already possesses.

Prof. Proctor explained more fully the reasons for believing that the moon is many ages older than the earth, and is, in fact, a dead planet, whirling through space without the cheerful influences of life upon its surface. Beautiful photographs of lunar scenery were exhibited, and the lecturer showed how it is probable that the great dark plains on the moon's disk that were formerly supposed to be, and that are yet called, seas, were once really covered by oceans like ours. These oceans, according to the theory now most generally accepted, have, as the inner portion of the planet cooled off, been gradually withdrawn into the interior, leaving the surface an arid waste. The vast size of the lunar volcanoes, the lecturer said, might be accounted for by the consideration that a much less resistance of gravity would have to be encountered in their formation on the moon than would be the case on the earth. The intense blackness of the shadows cast by the lunar mountains is one of the proofs of the absence of an atmosphere there.

More seems to be, in respect to age, intermediate between the earth and the moon. Careful maps of its surface show that Mars' oceans are much smaller than ours, and that the land and water on his surface are about equal in extent. Venus seems to be of about the same age as the earth which she more nearly resembles in size than any other point. We can even see the atmosphere of Venus, or at least the effect that it produces, when she is in transit across the sun's disk. At such times the dark body of Venus is seen to be surrounded with an arc of light which, demonstrably, is caused by the sunlight in her atmosphere.

All the orbs that circle through space are thus shown to undergo a process of birth, growth and death, and yet, the lecturer suggested, there may be orders of existence in the universe of which we known nothing; and what seems to us like death may only be an interchange of waste material from the higher orders to the lower.

HOW TO BUILD A SMALL ICE-HOUSE.

In answer to the inquiry of a correspondent, the *Prairie Farmer* gives the following plan to build a small ice-house:

"An ice-house simply to keep ice in for summer use may be a very simple affair. If straw is used for filling, the walls should be at least two feet apart. The interstices should be packed tightly whatever the material used. Straw is one of the poorest non-conductors, easily obtained, and sawdust one of the best. If tan bark is used, from ten to twelve inch space between the walls is left to be filled.

"Two-by-four inch scantling are securely fastened to bed pieces in two regular l
