Overworking the Undeveloped Brain.

"Overwork," properly so called, can only occur when the stress upon which the stress of the labor falls is immature, and, therefore, in process of development. When an organ has reached the maturity of its growth it can only work up to the level of its capacity or locality for work! Fatigue may produce exhaustion, but that exhaustion will come soon enough to save the organ. Repeated "efforts" may, under abnormal conditions, follow each other too rapidly to allow of recuperation in the intervals of actual exertion, and as the starting point will, in each successive instance, be lower than the previous one, there may be a gradual absence; but even this process should not seriously injure a healthy and well-developed organ. In short, a great deal of nonsense has been said and written about the "overwork" of mature brains, and there are grounds for believing that an excuse has been sought for idleness, or an indulgence in a vicious inertion habit, in the popular outcry on this subject which awhile ago attracted so much attention. Nevertheless there can be no room to question the extreme peril of "overwork" to growing children and youths with undeveloped brains. The excessive use of an immature organ arrests its development by diverting the energy which should be appropriated to its growth, and consuming it in work. What happens to horses which are allowed to run races too early happens to boys and girls who are overworked at school. The competitive system as applied to youths has produced a most injurious effect on the mental constitution which this generation has to hand down to the next, and particularly the next but one ensuing. School work should be purely and exclusively directed to development. "Cramming" the young for examination purposes is like compelling an infant in arms to sit up before the muscles of its back are strong enough to support it in an upright position, or to sustain the weight of its body on its legs by standing while as yet the limbs are unable to stand the burden imposed on them. A crooked spine, or weak or contorted legs, is the inevitable penalty of such folly. Another blunder is committed when one of the organs of the body,—the brain—is worked at the expense of other parts of the organism, in face of the fact that the measure of the general health is proportioned to the integrity of development, and the functional activity of the body as a whole in the harmony of its component systems. No one organ can be developed at the expense of the rest without a corresponding weakening of the whole.—*Lancet.*
