Killing at Columbus.

Columbus, Ky., was the scene of a killing last week. Harry Pearson, Jr., stabbed a young man named Henderson, a son of John Henderson, who lives in the river hills. They were drinking and had been quarreling for some time when Pearson walked up to Henderson and plunged a long-bladed knife in his side, just under the heart. Henderson died and Pearson has fled.

Health is Improving.

The doctors report a diminution of disease within the past few days, and one aptly remarked today: "Strange to say, all of our patients are getting well." During the last few weeks business for the medicos has been brisk, and most of them view the approaching lull with satisfaction and relief, as it will prove a welcome respite.

Incidents of the Nile.

Here are two incidents of the Battle of the Nile told by "one of the gunners' crew": One lad who was stationed by a salt box on which he sat to give out cartridges, and keep the lid close—it is a trying berth—when asked for a cartridge, he gave none, yet he sat upright; his eyes were open. One of the men gave him a push; he fell all his length on the deck. There was not a blemish on his body, yet he was quite dead, and was thrown overboard. The other, a lad, who had the match in his hand to fire his gun, in the act of applying it a shot took off his arm; it hung by a small piece of skin. The match fell to the deck. He looked to his arm, and seeing what had happened, seized the match in his left hand and fired off the gun before he went to the cock-pit to have it dressed.

Experiments with Wireless Telegraphy

Experiments are reported with wireless telegraphy during ten days between Chamonix and the Vallot Observatory, on Mont Blanc; the straight distance was seven and five one-hundredths miles and the difference in height two miles. After a description of the transmitting and receiving stations, the results are summed up as follows: The experiments were made every day during eleven hours. The signals were satisfactory only for a distance between the oscillator spheres equal to eight one-hundredths of an inch. The absence of water in liquid form did not interfere, neither did the intervention of clouds. Although atmospheric electricity actuated the apparatus several times, it did not make communication impossible.

Money Orders That Fail to Reach.

In the course of the last year nearly 50,000 money orders failed to reach the payees. The number of such cases increases from year to year, corresponding with the aggregate business. In many cases remitters hold the orders as receipts; in other cases failure to deliver is due to defective address; but the bulk of the loss occurs through the stealing of letters by persons in the employ of the payees or remitters. Whenever loss is reported, whether actual or alleged, a duplicate is drawn promptly, the issue of which makes the original void. In the last year the number of duplicates issued was 46,263, being an increase over the preceding year of 1,908.

Co[illegible] substances are well know[illegible] rious forms of nervous d[illegible] are readily traced to the pr[illegible] ducing them. Further research leads to the belief that alum is a prevailing cause of so-called nervous prostration, for the symptoms it produces on the nervous system after its absorption into the blood are very remarkable indeed. Experiments physiologically made upon animals by Orfila, Professors Hans Mayer, Paul Selm and others show that alum frequently produces no visible symptoms for many days after its introduction into the body. Then follow loss of appetite and other alimentary disturbances, and finally a serious prostration of the whole nervous system. The most prominent physicians now believe that "nervous prostration" and many affections of the nerve from which both men and women suffer are caused by the continued absorption of alum into the system. It is probable that many medical men are unaware of the extent to which salts of alumina may be introduced into the body, being under the impression that the use of alum in bread is prohibited. Alum, however, is still used surreptitiously to some extent to whiten bread and very largely in making cheap kinds of baking powder. In families where baking powder is generally used great care should be exercised to procure only those brands made from cream of tartar. The alum powders may generally be distinguished by the lower price at which they are sold.

TEA FLAVOR INJURED AT SEA.

Consequently Russian Epicures Have Their Supply Brought Overland.

Russian tea traders have received news that the great caravans will shortly start on their long journey across Siberia. Within recent years much of the tea consumed in Russia has made the sea voyage from Chinese ports to Odessa on the Black Sea, but Russians say that tea transported by sea loses much in flavor and quality. In consequence of this the largest tea merchants continue to receive the bulk of their stock by the overland route. Early in January the caravans arrive in Tomsk. Between the 1st and 20th of the month 19,000 sledges of tea are expected, each sledge containing five packages of about 130 pounds each. The tea is not packed in cases, but in stiffened ox hides. Five sledges are tied together and drawn by one horse. The last sledge of each group contains hay and barley, which the horse of the next group quietly munches as he travels. In consequence of this arrangement the caravans lose no time. The first horse only, who does not feed as he walks, is changed from time to time. The horses are changed in the villages along the road, but as villages are rarely met it often happens that the horse collapse from overfatigue. The leaders of the caravan, usually Kirghiz, sleep in the sledges, although the thermometer is often 40 degrees below freezing point. From the Chinese tea-growing districts to Tomsk is a year's journey [illegible] caravan.
