THE TRADE IN CHICAGO.

Chicago, Jan. 29 (Special).—Corn was easy to-day. There was a lot of selling by Western interests, presumably against country purchases, cliffed led in this sort of selling. May sold from 29¾c to 29¼c, and closed at 29¾c. All Western advices were of freer country offerings, the result of better roads West. The inspection was 198 cars, with 290 cars estimated for Monday. Clearances for the week were 4,940,000; clearances for to-day, 507,000 bushels. January is usually a bear month in corn. The tradition is that after the middle of February corn bulls have an easier time of it.

There was a very large line of oats sold, somewhere around 1,000,000 bushels by one concern, Baldwin-Gurney. This is supposed to close out a long line of May belonging to the Gates-Elwood crowd. There were about 2,500,000 bushels, and all has been sold out in the last three days at a small profit. May opened at 24¾c, sold as low as 23¾@24c, and closed at 24@24¼c. Receipts were 186 cars, with 250 cars estimated for Monday. Seaboard clearances were 43,000 bushels. Some shipping business was done to-day all-rail, about 250,000 bushels.

Provisions were dull, with hardly any change in prices. The last quotations were the same as Friday's. The jackers were not doing anything, even the scalpers showed very little interest. There were 28,000 hogs, near estimate for Monday was 38,000; for next week, 175,000. Shipments this week have been very light. Prices next week will depend on the movement of hogs.

On the curb "puts" on May corn were 29⅝c; "calls," 29¼@29⅜c.

COMPRESSED EARTH FOUNDATIONS.

From The Philadelphia Record.

The subject of doing away entirely with stone and mortar foundations is being discussed by the French engineers, compressed earth taking the place of these. The method is the conception of Louis Dulac.

It is well known that when a stake is driven into the ground a compression of the surrounding soil takes place, equal in volume to that displaced by the stake. In the method of Mr. Dulac an apparatus like a pileudriver is erected, but instead of the ordinary hammer-head ram, a heavy cone is allowed to drop, point down, in such a manner that it makes a hole, the size and depth of which depend upon the diameter of the cone and the height from which it has fallen.

The cone generally used is from twenty-four to thirty inches in diameter, weighing about three thousand pounds, and it is dropped from a height of thirty or forty feet. With a drop of this sort a hole equal in diameter to that of the cone and twenty to thirty feet deep may be made in a few hours, the time and depth depending, of course, upon the nature of the soil. The whole area upon which the structure is to be erected is thus treated, the holes being five or six feet apart between centres, and the result is the compression of the soil between the holes to an extent governed by the diameter and the distance between them.

After the holes have thus been made they are gradually filled with a concrete made of broken stone or cinder and hydraulic lime and cement. The concrete is thrown in shallow layers and pounded by allowing a spherical weight of about two thousand pounds to drop from about the same height as that from which the cone was dropped. The effect of this procedure is to drive the more liquid portion of the concrete into the walls of the pits, and thus, when the latter are filled and the concrete has become hard, the foundation consists not only of the buried pillars of stone and cement, but also of the compressed earth partly charged with cement.

This method of making foundations has been used with much success in various portions of Paris, some of the locations being considered very difficult, owing to the soft nature of the soil, and the system is now being used to prepare the ground for the erection of some of the buildings for the exposition of 1900.

The effect of the pounding of the earth is said not to extend to sufficient distance to disturb adjacent structures, and in a number of cases the method has been used in the immediate vicinity of old and weak buildings without apparent injury.

It is possible that this system of compression may be of service in many locations where the load is not too great, and it appears to be of especial applicability to foundations for temporary structures, avoiding the necessity of much digging.
