THE ZODIAC.

A Look Along this Great Celestial Highway.

A Learned Astronomer Interviewed by an Anxious Reporter.

[From the Detroit Free Press.]

The following conversation has been described as actually taking place between an astronomer and reporter. As will be observed their subject was in reference to that broad circle upon our starry heavens, very appropriately termed the zodiac, from a Greek word *zodiakos*; so named because the group of stars which it contains were supposed to represent figures of various animals. It is a belt sixteen degrees in width, inclosing the twelve signs, and inside of which all the large planets move from west to east over our firmament. Through the center of this wide zone the sun describes his apparent yearly revolution. This path, pursued by the solar orb in his annual course over our celestial vault, is denominated the "ecliptic." It intersects the equinoctial at an angle of twenty-three and one-half degrees. This is called its "obliquity."

The phenomena related to this great zodiacal pathway are full of interest, abounding with a multiplicity of valuable and instructive facts. Not without some entertainment and satisfaction, therefore, must the careful reader imbibe those many beautiful lessons disclosed in the following interview. In connection with what follows we are impressively reminded of these charming lines of Milton:

"Thus astronomers forsake a'er heaven's nocturnal arch,
Seen by the sages, in pomp celestial march;
See Aries there his glittering bow unfold,
And raging Taurus use his horns of gold;
With bended bow the willed Archer lowers,
And there Aquarius rouses with all his showers;
Circe and Cenaurs, Gorgons, Hydras rise,
And gods and heroes blaze along the skies."

Reporter—It seems strange that while the fixed stars are strewn all over the heavens the planets never leave the belt of the zodiac, as you tell me.

Astronomer—You may well think it strange. It must have been a source of wonder to the ancients to see planet after planet as it came up into conspicuous view, moving among the stars along the same great highway—a mighty train of wanderers—and this highway the annual path of the sun also. With us, however, wonder is lost to familiar experience. The sublime speculation of Laplace, assigning the genesis of our solar system to a process of revolution—famously known as the nebular hypothesis—has doubtless contributed to make us indifferent to the grandeur of the phenomena. For, when once a plausible explanation is offered for observed facts, and all related phenomena are shown to concur in pointing to this origin, they soon grow to be familiar and wonder is then at an end.

Reporter—Will you please trace out for me along the sky this curious path of the sun and planets?

Astronomer—You see red Mars well risen in the east, and Jupiter, yonder star of incomparable splendor, situated in the beautiful constellation Virgo. West of Jupiter, some twelve degrees, is a star of the second magnitude named Regulus, situated directly in the ecliptic. In the constellation Capricornus you observe Saturn shining with a pale white light to the naked eye, but in the telescope an object of incomparable sublimity and beauty.

Reporter—How far is a degree upon the firmament?

Astronomer—A convenient unit of measure is the distance of the "pointers" in the Great Bear from each other, which is just five degrees; and for longer measurements the distance from the pole-star to the middle of the line joining the "pointers," which is thirty degrees. For very small measurements, remember the apparent breadth of the sun or moon is about one-half a degree.

Low down in the west, and about to disappear from view, you perceive the great and magnificent constellation of Orion. In the midst are three stars in a row, and equally distant from each other. They form his belt. Follow the line of them in a northwesterly direction for about forty degrees, and you come to the glittering cluster of the Pleiades or "Seven Sisters," one of the most beautiful objects in our firmament.

Reporter—Yes, I see it! It sparkles like a cluster of diamonds.

Astronomer—That is it. It lies within the belt of the zodiac, and a little to the north of the ecliptic. Half way between the Pleiades and Bellatrix, the nearest of the two upper bright stars in Orion, which mark his shoulders, you will observe a star of reddish lustre and a brightness superior to Bellatrix. That bears the fine old Arabic name of Alderbaran. It is also within the zodiac, and about as far south of the ecliptic as the Pleiades are north of it. With these landmarks I think you can follow me as I trace out for you this pathway of the planets and describe the regions through which it lies. Following up along the starry vault the line of Saturn, Mars and Jupiter, which, with Regulus west of them, are included in the zodiacal highway, we pass into Cancer. This constellation enjoyed the honor, upward of two thousand years ago, of containing within its borders the chosen resting-place of the sun in his annual northern journey, and of giving name then, at the birth of practical astronomy, to the "summer solstice," a name which it still holds, although the constellation itself is now some degrees at its nearest border, east of the solstice or "first point of Cancer."

Reporter—What is the explanation of that? I thought the stars were always fixed in position upon our celestial vault.

Astronomer—So they are, relatively, or nearly fixed. Cancer is now where it was ten thousand years ago, but the solstice has moved to the westward in that time about four-fifths of the way across the visible firmament.

Reporter—In what constellation is the summer solstice now?

Astronomer—On the border of the Twins and Taurus. You may see yonder the stream of the Milky Way sweeping across the heavens from the northeast to the southwest. Now look along the line connecting the pole star with the brighter of the two stars in the shoulder of Orion, the one which has a reddish color, bearing also a fine Arabic name, Betelgeuse. Near where this line enters the Milky Way on the east, is the summer solstice, and there the sun will be on the 21st of June. In the fine constellation Gemini or the Twins, are two bright stars of about equal lustre, which point northwest and southeast. They are the "brothers"—Castor preceding and Pollux following. They are situated in the upper part of the constellation of the Twins.

Passing on out of this fine constellation and crossing the great astral stream, keeping the Wagoner, with its bright yellow star Capella, on our north, and the great constellation of Orion on our south, we pass between the horns of the Bull into the beautiful stellar aggregation of Taurus. The tips of the horns are marked by two stars about seven degrees asunder, which point down towards the red star Betelgeuse, of Orion. In the constellation Cancer, there now lies hidden from the naked eye the planet Uranus, which Sir William Herschel brought to light, and which long passed under his name. It to-day occupies almost the same position in the heavens which it had in the year 1781, when it stole into the field of Sir William's great reflecting telescope without so much as waiting to be invited.

Reporter—I think you told me that the motion of Uranus was very slow, owing to its enormous distance from the sun.

Astronomer—Yes. This planet has a very long period. You will no doubt be surprised when I tell you that it has completed only one orbital revolution around the sun since its discovery in the last century. This planet requires eighty-four of our years to make a circuit about the solar orb.

Some five degrees west of the fine red star Aldebaran is the famous sisterhood of the Hyades, a cluster of minute stars much less conspicuous than the Pleiades. Pursuing our career midway between these two clusters, we cross the neck of the Bull and enter Aries, marked by two stars nearly equal in lustre. As Cancer lends its name to the summer solstice, so this constellation gives name to the "vernal equinox," which is known among astronomers as the "first point of Aries," though situated in the constellation of the fishes.

Reporter—What marks the place of the vernal equinox?

Astronomer—It has passed below the western horizon.

Reporter—You have spoken of Saturn, Jupiter, Uranus and Mars. Where are the rest of the planets?

Astronomer—They are all below the horizon. If we could reverse the earth's rotation upon its axis and call back the evening twilight and setting sun, there would rise in the west in a few hours, the summer solstice or "first point of Aries," and not long afterwards Neptune, the remotest of all the planets and the oldest—if the nebular theory is correct—whose discovery in the year 1846, from pure theory alone, has immortalized the names of Leverrier and Adams. Shortly after Mercury would appear, lost indeed to the naked eye in the growing brightness of the twilight. Fifty or sixty minutes later the sun would rise, blotting out the night and stars again. Venus being now a "morning star," is westward of the sun, and would also come into view in the restored daylight. On the other side of the globe, indeed, to the Persian and semi-civilized dwellers about the Caspian and Aral Lakes, Venus is at this moment risen in the east, as their bright "morning star."

Reporter—The effects you describe as resulting from a reversal of the earth's rotation are said to be actually witnessed by aeronauts when their ascension is made just after sunset. The settling darkness is soon scattered, the western horizon grows brighter and brighter precisely as at dawn, and shortly afterwards the sun bursts upon the night with all the gorgeous atmospheric effects of sunrise.

A. K. BARTLETT.

The Model Hotel.

A GRAND PROJECT FOR A SUMMER HOTEL—WHAT A SMART GUEST MAY SAFELY DEMAND—THE ACCOMPLISHMENTS NECESSARY TO THE PERFECT HOTEL CLERK.

If there is one man in the world who thinks there is anything about running a hotel that Mr. T. E. Roessle, of the Arlington and Fort William Henry Hotels, don't know, that man is probably the person who forwarded the following MS., addressed "T. E. Roessle, proprietor of the Arlington, Washington, D. C.:"

A few of the friends of progress are forming a joint stock company for the purpose of building a summer hotel which, it is hoped, will suit the requirements of the age.

The following are a few of the suggestions which will be adopted by the company, and it is hoped, that you, as a hotel proprietor of some experience, will favor us with any further ideas that may occur to you:

The hotel will be built and arranged for the special comfort and convenience of summer boarders.

On arrival each guest will be asked how he likes the situation, and if he says the hotel ought to have been placed upon the hill, or farther down toward the village, the location of the house will be immediately changed.

There will be a corner front room up one flight of stairs for every guest. Baths, gas, hot and cold water, laundry, telegraph, restaurant, fire-alarm, bar-room, billiard tables, daily papers, sewing machine, grand piano, a clergyman and all other modern conveniences in every room.

Meals every minute if desired, and consequently no second table. English, French and German dictionaries furnished every guest, to make up such a bill of fare as he may desire, without regard to the "*bill o'fair*" afterwards at the office. Waiters of any color or nationality desired. Every waiter will be furnished with a libretto, buttonhole bouquets, full dress suit, ball tablets, and his hair parted in the middle.

Every guest will have the best seat in the dining room and the best waiter in the house.

Any guest not getting his breakfast "red hot," or experiencing a delay of sixteen seconds after giving his order for dinner, will please mention the fact at the office, and the cook and waiters will be immediately blown from the mouths of cannon, placed in front of the hotel for that purpose.

Children will be welcomed with delight, and are requested to bring hoop-sticks and hockeys to beat the rosewood furniture, and peg-tops to spin on the velvet carpets. They will be allowed to bang on the piano at all hours, yell in the halls, slide down the balusters, fall down stairs, carry off enough dessert in their pockets to supply a small family, and make themselves as disagreeable as the fondest mother can desire.

Washing permitted in the rooms, and ladies giving an order to "put me on a flat iron," will be put on one at any hour day or night.

A discreet waiter who belongs to the Masons, Odd Fellows, and Knights of Pythias, and who was never known to "give anything away," not even to tell the time of day, will be employed to carry milk punches and hot toddies to ladies' rooms in the evening.

Every lady will be considered the belle of the house, and hall boys will answer the "bells" promptly.

Should any hall boy fail to appear at a guest's door with a pitcher of ice-water, more towels, a gin cocktail, pen, ink and paper, before the guest's hand has left the bell-knob, will be branded "*scum*" on the forehead and imprisoned for life.

The office clerk will be selected to please everybody. He will be able to lead in prayer, play draw poker, match worsted at the village store, shake for drinks at any hour day or night, play billiards, dance the Boston, lead the German, make a fourth at euchre, amuse children, repeat the Boucher trial from memory, and be a good judge of horses. As a railway and steamboat reference he will be superior to Appleton's or anybody else's guide. Will flirt with young ladies, and not mind being cut dead when "Pa comes down," and won't mind being damned any more than the Connecticut river. Will be able to room forty persons in "the best room in the house," when the hotel is full, attend the annunciator, and answer questions in Greek, Hebrew, Choctaw, Irish, or any other modern language, without turning a hair.

Dogs allowed in any room in the house, including the "white room."

Gentlemen may chew, smoke, drink, tell shady stories, stare at new arrivals, &c., in any part of the hotel.

The proprietor will always be glad to hear that some other hotel is the best in the country, and especial attention will be given to parties who can tell how these things are done in "Yewrop."

The management will take it as a personal affront, if any guest, on leaving, should fail to dispute his bill, tell him he is a swindler, his house a hare, his table wretched, his wines vile, and that he (the guest) was never so imposed upon in his life—will never stop there again, and means to warn his friends.

Changes in the Earth's Surface.

It has been proved that the whole Pacific coast, especially California, with all its mountains, is perpetually rising, and that at a comparatively rapid rate. The land containing in its bosom our great American lakes is slowly sinking; while southern Indiana, Kentucky, and the surrounding States are rising. Geological investigations prove that our great lakes, except Ontario, had formerly a southern outlet; until, by gradual northern depressions and southern upheavals, a northern outlet was formed from Lake Erie into Ontario, about 40,000 years ago. This outlet, the Niagara river, is still wearing away its channel. The division line of the watershed south of the lakes and the Mississippi valley, has since that time been steadily traveling southward; and when Chicago recently turned the waters of Lake Michigan, through the Chicago river, into the Mississippi valley, the old state of affairs was artificially re-established. New Jersey is sinking, with New York city and Long Island, at the estimated rate of about 16 inches per century. The coast of Texas is ascending at a comparatively very rapid rate, some observers stating that it is as much as 30 or 40 feet in the last half century.

Combining these observations with the results of the recent deep sounding of the United States steamer Tuscarora in the Pacific Ocean, we find that the bed is evidently a sunken continent, abounding in volcanic mountains, some 12,000 feet high, many of them not reaching the surface of the ocean, and others which do so forming the numberless islands of the Pacific. The study of the coral rocks proves that this sinking has continually been taking place during several centuries, and the observations of the coast will undoubtedly reveal the fact that it has not yet ceased.

The most eminent German geologists and ethnologists maintain that the locality of man's primative origin, the seat of the so called Paradise, was in the Pacific Ocean, south of Asia whence the race diffused itself northward to Asia-Westward to Africa, and eastward to Australia. When the great Pacific continent slowly sank, so that the ocean commenced filling the valleys, man retreated to the mountains, which by continued sinking, were transformed into islands, and now form the many groups of Polynesia. The insularity of the thus preserved races was not productive of civilization, which requires conflict, in which the superiors in the end gain the victory over the inferiors. In those islands, the inferior races were preserved for want of this conflict, hence their savage condition even at the present day; while primitively the greatest advance took place at the spot of the most intense conflict, the continent of Southern Asia.

LOSS OF LIFE FROM FLOOD, FIRE, EARTHQUAKE, ETC.—The loss of human life from flood, fire, earthquake, etc., during the last six months has been very great. The following shows the loss, so far as the facts and figures have been published:

By flood, in Toulouse, France, 215 (and probably more, these figures representing only the bodies found;) from measles in the Fiji Islands, 50,000; by the overflow of the Danube in Pesth, 600; from earthquakes, in New Granada, 16,000; in Asia Minor 2,000; in the Loyalty Islands, where the earthquake was accompanied by a terrible tidal wave, 2,000; at Santo Cristobal, Mexico, 70; by famine in Asia Minor, 20,000; from marine disasters, by loss of the Schiller, on the Scilly Islands, 350; the Gottenburg off the Australian coast, 166; the Cadiz, 62; the Fu Sing, a Chinese steamer 50; the American ship Violetta, 42; the Vicksburg, collision with icebergs, 40; the Thornabia, 29; the Cortes, 26; the George Batters, 21; the Bride, Berar, Berbo, (Japanese) and the Alice, 20 each, and the Lochnagar, 16. There have been other severe disasters on the South American, Chinese and English coasts which involves a serious loss of life, but it is impossible to estimate them, as the telegraph furnishes no record. From tornadoes and hurricanes the loss of human life has been as follows:

In Hong Kong, 500; Georgia, 317; Chile, 60; Louisiana, 20; France 11; Missouri, 6; Mississippi, 11; Arkansas, 5; Michigan, 3; Wisconsin, 3; Illinois, 3; South Carolina, 2; and Kansas, 1—total, 944. Thirty-five fires have been reported, by which 304 lives have been sacrificed. Only three of these have been accompanied by a heavy loss of life, being the burning of a match factory at Gottenburg, Sweden, 50; steamers at New Orleans, 75; and the recent Holyoke (Mass) church disaster, 92. Explosions have killed 207 people. Total, 78,812 in six months, and the whole story not yet told.

MARK TWAIN GOING TO STAY HOME.—Mark Twain is as fully determined as ever not to lecture any more. He writes as follows:

DEAR RIDPATH: Here you are again with your customary annual lecture temptations! Your offers have been prodigal before; but this time you surpass yourself when you say you will pay me whatever I ask. At first I thought I would take you up and go into the lecture field once more, charging you a million or perhaps two million dollars a week. But I consulted with friends of mine, and they said, with strong profanity, that it was too much. Now that comes from people trying to talk about a thing they do not know anything about. If those persons had ever gone lecturing a whole horrible winter, through mud and slush, they would have known that my terms were not only reasonable but divinely cheap. However, the violent remarks of my ignorant friends, have decided my course; I will not lecture at any price. But, joking aside, Redpath, I really cannot go upon the platform the coming season. All last winter I sat at home drunk with joy over every storm that howled along, because I knew that some poor dog of a lecturer was out in it. I am expecting to have just as good a time next winter, and do not think it is noble in you to want to deprive me of it. Yours, with affection,

MARK TWAIN.
