

POULTRY FACTS

ORIGIN OF WHITE WYANDOTTE

White Cochins Blood Was Introduced in Making of Breed as Feathers on Legs Would Denote.

A question has been asked relative to the Wyandotte breed, and why the White Wyandotte will sometimes show a dark feather and even show a faint ruff of feathers on its legs? There are several varieties now of the Wyandotte, but the first to be admitted to the standard was the Silver Wyandotte. From the first the Silver Wyandotte had the rose comb. The next

Flock of White Wyandottes.

variety of Wyandottes to be admitted was the White Wyandotte. The Towle and the Briggs Wyandottes were the first to be shown, each of these fanciers stating that the White Wyandottes kept by them came as sports from the Silver Wyandotte, and yet claim it is made that no one can tell exactly where the first Wyandotte originated, as several breeders thought of breeding for this type of fowl at about the same time, and that all the early White Wyandottes were sports from the Silver variety is not likely to be true. It is thought that White Cochins blood was introduced in the making of the White Wyandotte at the beginning, as the size, shape and color of the eggs not only denotes this, but that feathers appear at times on the legs makes this seem probable. Why dark feathers often appear in certain of these birds good enough to show is often a mystery to the breeder. These seldom appear in such numbers that they cannot be pulled out. The purest blood may show these. However, White Wyandottes are improving away from most of their early tendency to reversion.

HOME-GROWN POULTRY FEED

Not a Difficult Task to Get Eggs During Winter if Ordinary Horse Sense is Exercised.

To get eggs in winter under the conditions obtainable on a general farm is, I find, no difficult task if ordinary horse sense is used in the matter of feeding and housing. W. K. Moore in an exchange. As far as possible I use the food grown on the farm, feeding as soon after daylight as practicable a mash composed of fine corn chop and alfalfa meal, half and half by measure. Feed all the birds in one pen, and mix the feed in the morning. The mash will clean up by noon, then give about one gallon of oats to each 100 hens, scattering it in straw litter in the scratching shed or hen house. At noon, or shortly after, I give all the corn they will clean up by night, and let them shell it.

For a meat food I get good results from the cracklings obtained from the local butcher for one cent per pound. For this I give about two pounds to every hundred hens three times a week. I find that a good way to do this is to mix the cracklings in the mash when steaming it; this softens them so that the fowls will get every part that is not bone. I keep oyster shell and dry cracked bone before them at all times.

The mash referred to is mixed dry, and boiling water is poured over it and it is left to steam for at least two hours—or better, over night. For variety, I mix with the mash potatoes, beets or anything of the kind that is obtainable; however, a diet of oats, corn and alfalfa, with a little meat, will give good profit in eggs.

The poultry house must be air-tight and water-tight on four sides, the top, north, east and west. The floor may be of earth if proper drainage is arranged so that it will always be dry, and most of the south side may be made of common unbleached muslin.

Feed White Clover Hay. White clover hay is the richest in lime. Feeding clover is a preventive of soft-shelled eggs. Cut clover hay has helped revolutionize the poultry business. Red clover hay contains about twenty-eight pounds of lime to the thousand pounds. Scald the hay at night, and keep it covered, so it can steam. See that the clover is cut to one-third to one-half inch lengths. When longer it is apt to pack in the crop, causing crop-bound.

Talking Through His Hat. When you hear a farmer saying one hen is as good as another, don't waste time trying to find his name among those who attend farmers' institutes. If you don't find him at home he is talking politics at the corner grocery.

Wood's Seeds

Wood's Descriptive Catalog for 1915 has been carefully prepared so as to enable our farmers and market growers to determine intelligently as to the best and most profitable crops which they can undertake to grow.

Farm and Garden Seeds

that can be planted to profit and advantage. Write for Descriptive Catalog and prices of seeds. Grass and Clover Seeds, Seed Grain or Seed Potatoes required. Catalog mailed on request. T. W. WOOD & SONS, Seedsmen, - Richmond, Va.

FOR REMOVING SILAGE

Description of Devices in Use for That Purpose.

Overhead Feed Carrier is Advisable Where Silo is Adjacent to Feed Yard—Much Depends on Number of Stock to Be Fed.

(By L. W. CLARE) From two to three inches of silage should be removed from the entire surface of the silo daily during the summer months and at least half of this amount in the winter. In the above-ground silos the silage may be dug loose with a silage fork and allowed to fall down through the chute to the ground, where it may be loaded into the cart or carrier and fed where desired; or it may be dropped directly into a cart, carrier, or wagon, and taken to the stock.

If the silo is adjacent to the barn and there is a smooth way from silo to feed manger, a simple silage cart is the most convenient device for

Illustrating How a Swing Track May Be Attached to a Strong Silo and the Silage Distributed to Several Feed Bunks.

taking the silage to the stock. The cart can be left beneath the silo chute and filled from above without removing the silage. Loose silage weighs about 18.5 pounds per cubic foot, and this should be given consideration when building a cart for a definite capacity.

More often than otherwise the silo stands either in or adjacent to the feed yard, in which case there is very seldom a smooth way from silo to bunks. An overhead feed carrier is then generally advisable. This depends upon the number of stock to be fed. Such a carrier may easily be arranged. If the yards are small, a swing track may be attached to the silo and the silage distributed to several feed bunks.

When several carloads of stock are being fed silage, the most convenient scheme is to throw the feed into a wagon and distribute it to the feed bunks with a team.

Some sort of hoisting device should be used in pit and semipit silos. Where the pit is more than ten feet deep, hand hoists and power hoists are being used for this purpose. The simplest hoist is that of the bucket raised hand over hand, but this requires one person in the pit and another above ground. A better scheme and one which is practical where the silo is located in the barn between the mangers, is to obtain several buckets and equip them with stiff balls, then use them as follows: Fill the buckets and place them in the silo convenient for raising, climb out of the silo, and by means of a hook on a rope, hook a bucket of silage to it and hoist it out. After the bucket is emptied, drop it back into the silo, release the hook, and hook another bucket.

A homemade hoisting device for semipit silos and which can be adapted to pit silos as well, consists of a three-inch pipe carrying a wooden wheel and two drums. An old milk can filled with scrap iron is used as a counterweight. It should be slightly lighter than the weight of the cart and the silage.

A horse-power hoisting device is easily used for silos entirely below ground. These silos have an opening in the roof through which silage is hoisted. The carrier is a box about four feet long by two feet wide, having a hinged bottom. The box is hoisted and pulled over to the dump chute by means of one horse. A trip rope allows the operator to dump the silage through the chute and return the carrier. An ordinary hayfork cube and carrier are used. This same arrangement may be used for feeding into several bunks.

Well-Fitting Collar. See that the collar is large enough, and fits properly to the shoulder of the horse. Sore neck is usually caused by a pinching of the collar. Never carry buckles or snaps on the harness in such a way that they may work under the collar and cause ugly sores.

Beauty in Straight Rows. Straight rows enhance the appearance of the orchard. It will pay to have a surveyor set the stakes for the trees.

"The Best Laxative I Know Of." "I have sold Chamberlain's Tablets for several years. People who have used them will take nothing else. I can recommend them to my customers as the best laxative and cure for constipation that I know of," writes Frank Strouse, Fruitland, Iowa. For sale by all dealers.—Advertisement.

C., with the Horticultural Board before coming here and their ideas of producing FIRST CLASS SEED have been carried out to the letter for J. Bolgiano & Son's growing season. There was nothing planted but the very best selected seed, and nothing has been left out to harm them right. The crop is now being harvested, and the results of my work are most satisfactory. We are harvesting one of the largest crops ever grown in Annapolis County, Maine, and of the finest quality, free from any disease and free to some. I spent some time in Washington, D. C., with the Horticultural Board before coming here and their ideas of producing FIRST CLASS SEED have been carried out to the letter for J. Bolgiano & Son's growing season. There was nothing planted but the very best selected seed, and nothing has been left out to harm them right. The crop is now being harvested, and the results of my work are most satisfactory.
