TAFTVILLE

Meeting of Ladies' Benevolent Society—Notes.

There was a good attendance at the regular meeting of the Ladies' Benevolent society of the Congregational church, held Wednesday afternoon in the church parlors.

Notes. Arthur Bouchard of New Bedford was visiting local friends for a few days.

Albert Abern was presented a handsome dining room table by his shopmates, Monday evening.

John Brown, for the past nineteen years fireman in the plant of the Peenah company, severs his connection here on Saturday and will move with his wife and son, Robert, to Springfield.

YANTIC HAPPENINGS.

Fresh Young Men from Norwich Cry "Fire!" and Call Out Volunteers—Personal Items.

Some hilarious city young men, returning from the Fitchville ball late Saturday night, about 12:30, going through the village, just for the excitement. As the village volunteer fire department has always responded and always fought hard for fires, a number who were aroused unnecessarily are not at all pleased with the acts of the rioters.

Briefs and Personals. Mr. and Mrs. George LaVelle of Halleville spent Sunday with relatives here.

G. Delarge has moved his family and household effects to Halleville.

Tax Collector Robinson was in the village store Tuesday morning.

Mrs. Charles Arnold and daughter, Ella, have returned to Pomfret after a week's stay with Dr. and Mrs. H. H. Howe.

Miss Watsons of Groton spent Tuesday in the village.

Mr. and Mrs. I. H. Stoddard of Lord's Point, Stonington, spent Tuesday with relatives here.

A number of grass fires have been started in the village during the past week, caused by locomotive sparks.

Miss Cecelia Cohn is the guest of her sister, Mrs. Louis Schwartz of New London.

Mr. and Mrs. Vigueur have moved to Hope Valley, R. I.

Mrs. Frederick Kingsley was a visitor at Ballie Monday with her sister, Mrs. John Finn.

Walter Poettner of Skaneateles Falls, N. Y., has been spending a few days here.

Eastern Connecticut Insect Pests Gypsy Moth Wiped Out at Stonington But Brown Tails Are in North Eastern Section.

The general public will be pleased to learn that the gypsy moth has apparently been exterminated at Stonington, where the state authorities have been fighting it for several years; also that it has been nearly wiped out at Wallingford. The brown-tail moth has spread into the northeastern corner of the state, and will gradually spread in this direction, though cutting off the nests last winter could not fail to check the pest.

The eleventh report of the state entomologist, which has just been issued as Part IV of the annual report of the Connecticut Agricultural Experiment Station, at New Haven, contains information on the pests just mentioned, as well as on several others of major and minor importance.

A full account is given of the leopard moths, which have caused such destruction of shade trees in New Haven and other coast cities. This information is summarized as follows:

The leopard moth occurs in Europe and parts of Asia and Africa, and was probably accidentally introduced into this country from Europe more than thirty years ago, being first noticed at Hebboken, N. J., and later spreading toward the north and east, along the coast. At the present time it is found from Asbury, N. J., to Lawrence, Mass., but has not been taken more than 25 miles inland.

The larvae or caterpillars cause great damage to nearly all kinds of shade trees by boring in the branches just under the bark and cutting large galleries, often across the grain, thus girdling them. Dead branches extending above the mass of foliage in the tree-tops are a sign of attack, and many twigs will be broken off or wither during the summer. The pest has been especially destructive to elm and silver maple trees in the coast cities and towns of Connecticut, but is not so abundant in the open country.

It has caused much damage also in the cities of New Jersey, New York city, Providence, Cambridge and Boston.

The adult moths are dirty white with semi-transparent wings marked with metallic blue dots. These have an expanse of one and three-fourths inches in the male to two and one-half inches in the female. The larva is yellow with white markings, and has brown or black dots, and about two inches long.

The moths appear about July 1st, and the males being very common around electric lights, and the females lay eggs singly or in groups of two, three or four, in the crevices of the bark or near the buds. The larvae, hatching in a few days, begin to tunnel in the twigs, and by the end of the season are about one inch in length. They leave the small branches and crawl over the bark to enter larger ones, cutting large galleries in them and exelling the frass through round holes, which they soon close with silk webs. During October the borers go deeper into the wood, and remain through the winter two inches or more beneath the bark. They pupate in their burrows the second spring, and before the moth emerges the pupa works itself partly out of the opening, and the adult flies away, leaving the empty case protruding from the burrow.

There are few natural checks only one parasite being known in this country and four in Europe. It is believed, however, that certain birds, especially woodpeckers, prevent the spread of the leopard moth in the open country. Many larvae are doubtless killed by the breaking off of the branches, which in cities are carted away and destroyed.

Removing infested branches; injecting carbon disulphide (bisulphide) into the burrows, and stopping the openings; probing with a hooked wire for the larvae, are some of the methods of control.

Planting species of trees not badly infested, like oaks, honey locust and sycamore, and especially those kinds that do not grow very large, and have a smooth bark; placing trees further apart, so that the larvae cannot easily crawl from one to the other, and keeping the trees well nourished and vigorous, are the chief preventive measures.

The report shows the benefits from apiary inspection and reviews also the work in inspecting imported and growing nursery stock.

The periodical cicada or 17 years locust, which appeared in this state last year, is fully described and figured.

Other insects treated in this report are the onion maggot, the maple leaf-stem borer, a pyralid pest of hawberry hedges, the peach sawfly, the white pine weevil, the Colorado potato beetle, the cherry tent-maker, the poplar tent-maker, also how to get rid of flies and ants. Brief notes are given regarding a dozen other insects.

SHOWS A SURPLUS AFTER DIVIDEND. New Haven System Had No Difficulty in Maintaining Rate.

Official income account of the New Haven for the six months ended Dec. 31 last falls, for the time being at least, all doubts as to the ability of the road to maintain its long established rate of 4 1/2 per cent. The report, including results of operations of subsidiary lines, with all intercompany relations eliminated, full six months' dividends earned with a surplus of \$1,504,932, or a divisible surplus equal to 4 1/2 per cent, on the amount of New Haven stock in the hands of the public. In the fiscal year ended June 30, 1911, the combined income statement of the New Haven system showed a small deficit after dividends of \$212,252. The combined statements include income of all subsidiary electric and steamship lines of New Haven, and dividends are computed on the amount of stock actually outstanding, and not including the \$2,171,300 held by the New England Navigation Co. and the Rhode Island Co.

The New Haven proper, i. e., the steam railroad, reports a deficit for the six months, of \$1,942,227, after dividends. This, however, is rather misleading, as no part of dividends from subsidiary lines payable to the parent company June 30 next is included in "other income." This deficit of practically \$2,000,000 in the six months must not be construed as a sum of \$2,000,000, but as a total other income of \$4,589,454. As a matter of fact, New Haven's other income for the current year will be fully as great and probably greater than for 1911, the combined statement now shows the predictable surplus of subsidiary operations. Thus the true "other income" for the six months is at least \$1,200,000 greater than that actually received, this amount being the six months' proportion of the total profit of the New Haven's actual deficit for the half year may thus be stated to be not over \$800,000. And this is after allowing dividends at the rate of \$1,315,378 per annum, compared with \$1,445,832 in the 1911 deficit. The latter figure is a total of \$1,445,832, the other hand New Haven's first half year always produces about 55 per cent. of total annual net.

New Haven's working capital in the six months from July 1 to December 31, has been reduced \$13,590,000 from \$44,317,286 to \$30,727,011. Comparison of current assets and liabilities as of June 30, and Dec. 31 last compares:

Table with 2 columns: 1911 and 1912. Rows: Current assets, Current liabilities, Excess assets.

The decrease in current assets is due to the sale last summer of the Boston bonds which were carried in marketable securities. The sale of \$7,874,025, was expended for equipment and construction purposes.

The feature of the two six months' reports is the increasing profitability of the subsidiary companies, which at last appear to be in a position to contribute materially to the parent company. The surplus of \$1,500,000 for the New Haven railroad system over and above proportional dividends on the stock is, of course, due directly to these subsidiary operations.

LEFFINGWELL BAPTIST SOCIETY.

Missionary Meeting Held With Mrs. Frank Tyler, With Interesting Programme.

The Woman's Missionary society met on Wednesday afternoon with Mrs. Frank Tyler, in charge. The subject of the evening was "The Kingdom of God is Within You."
