

FARM AND ORCHARD.

Bedding for Livestock Ought to be Provided for.

Corn Huskers—Skim Milk—Flint Corn—How Aged Fowls can be Made Tender—Other Items.

In some sections of the country one of the important matters that should engage the attention of farmers after hay-making is the supply of bedding or litter for the livestock when the animals are confined in the stable. It seems scarcely necessary to say that something for use as bedding ought to be provided upon every farm. It should be supplied in abundance for cows that are giving milk in order to aid in keeping them clean. In horse stables it ought to be freely used to prevent injury to the feet, eyes and general health of the horses, which will otherwise result from the ammonia which is formed by the decomposition of urine. It is also required, wherever animals are confined, for the purpose of absorbing and keeping from waste the liquid manure. Provided the manure itself receives proper attention, there are few kinds of work on a farm which it is possible to omit that pay better for doing than the securing of a liberal quantity of material for bedding.

Various kinds of material are used for bedding and give good results. On many farms straw is used. This, on grain farms, has the advantage of being already on hand, and it is a very good substance to use. On farms which do not produce much grain, and sometimes on those which do, it may be possible to secure other material which will answer the purpose very well. Swales, in the governing lots or the pastures, or meadows producing grass that is too coarse and poor for hay, may often be utilized for this purpose. Farmers having more of this land than they can utilize for any other use give the grass on the part which they do not go over to their neighbor on condition that the latter will cut the grass clean and cart it away, and both parties are benefited by this arrangement. Where nothing of this kind is available, or the supply is insufficient, it is often possible to obtain a quantity of leaves, and where leaves are abundant it will probably pay well to gather a quantity of them, and if straw and coarse hay have already been secured. Another substance, and one which in some respects is superior to any other for use as bedding, is dry earth. This is a very good substance to use, and it is a powerful deodorizer. It thus serves two very important purposes, and it has the additional merit of preventing rapid and excessive fermentation of the manure. It is desired to convert the straw or the coarse hay into manure, it may be run through a feed cutter and mixed with the dry earth. It will be useful as bedding and will increase both the quantity and value of the manure.

If earth is used for bedding it should be free from stones and gravel and it should be thoroughly dried before it is stored. It ought to be placed in a shed or stable in which it can be kept, and it will save a good deal of time and work when it is used if it is stored near where the animals, under which it is to be placed, are stabled. If straw, coarse hay, cornstalks or any similar material is used for bedding, they should be cut into short pieces before they are put into the stables. This will largely increase their capacity for absorbing urine, will greatly facilitate the work of cleaning the stables, and getting the manure upon the land, and will also keep the manure in much better condition than it would be if the cutting was neglected.

While almost any vegetable material that is not too coarse or hard can be made serviceable for bedding, it is well to avoid the use of weeds and wild grasses which have just ripened their seeds. A large proportion of the seeds will be destroyed by fermentation of the manure, but many of them would survive and would be liable to grow where plants of their description are not wanted. If plants of undesirable kinds are used, they should be cut before their seeds are matured, or else be allowed to stand until their seeds are so ripe that they will shell in the field while the material is being harvested.—American Farmer.

There is an advantage in having a dog that is trained to drive cattle and sheep to and from the pasture, as he will save time and labor that must be performed by a person. It is a great pleasure to make butter from a beautiful, thoroughly bred herd of butter cows, and, what is better, it pays. The queen bee has been known to live fifteen years, and to produce fertile eggs during the whole of that period of time. If you desire large strawberries in the spring use fine manure on them and chop it into the top soil between the rows. You cannot use too much manure on strawberry vines at this season. It is always dangerous to allow the bull to have his liberty. He should be "ringed" and placed under control. The gentlest bull becomes vicious when aged. There is no reason why a bull should not be made to work on the tread powers. Eating at the straw stack does not indicate that straw is sufficient for cattle, and that it can be used to serve the purpose of good hay. It means that the animals like a change of food occasionally. Ducks lay more eggs in a year than do hens, but they perform the greater share of their work from January to July, at a season of the year when eggs are low in price, but it may be said in their favor that the cost of keeping ducks is very little in summer if they have the run of a pasture. It may save food to turn a hog into the woods to feed on nuts, but the hog that is capable of roaming through the woods has too much activity for a hog, and requires more than the necessary allowance when penned up for fattening on grain. It is better to grow some crop that will find a market nearer home than to endeavor to produce an apparently more profitable article that must be sent a distance to be sold. The cost of transportation, handling and having the receipts must all be deducted from the receipts. Fowls that have some age on them are made tender and the flesh more juicy by being kept confined in close, clean quarters for two or three weeks before being killed, and having nothing to eat but corn and pure water. Chickens should be confined in the same way and with the same food, but a week is sufficient, if they are in good order when shut up. The farmer who makes beef his specialty uses bulls from a beef-producing breed, and the farmer who depends upon milk prefers to breed from milk-producing breeds, but there are hundreds of farmers who take a pride in their calling, and yet do not know anything about breeds. Until they educate themselves on so important a matter they will make no progress. If manure is to be exposed to the leaching of the rains it is best to haul it out on the fields and spread it, provided the land is not subject to washing from heavy rains. It is better to have it exposed on the land, especially if the land has been plowed, where the soluble matter will be carried down into the soil to have it flow away in a black stream from the barnyard. Disease in the milk does not always come from filthy cans or the water added as an adulterant, but sometimes from the condition of the cow. Many herds are compelled to drink stagnant water from pools in the fields, and often they have no water at all other than the quantity they receive from the pasture. Manure is as much a crop as anything else, and really the most important one. The farmer who gives his manure extra

Royal Baking Powder. Highest of all in Leavening Power.—Latest U. S. Gov't Report.

attention will no 'fail to manage properly in other departments of the farm. The manure heap is the riches of the farm that have been unsold, and which are to be converted into readily salable products next season. Every farm should have a well-kept lawn and flower-garden. It costs little work and less money, and will be a source of joy to all. Whether cornland should be plowed shallow or deeply is unsettled. It is generally accepted that the land should be thoroughly worked over at first, being plowed deeply and harrowed, but the cultivation of the crop should be shallow. Experiments at the Indiana station last year show that the highest yields were when shallow cultivation was given, and that corn is a plant which requires but a slight stirring of the soil. The best breed of cattle for producing oxen is the Devon. It is red in color, very active, can subsist where some breeds are not adapted, and for hardness is unexcelled. It does not compare favorably with some breeds for producing milk, butter or beef, however, but it is a favorite with some, owing to its adaptability to hillside pastures. Corn huskers, which husk the corn and cut the fodder into shreds, are now used. Standing corn is also cut by corn harvesters. With the riding plow, riding cultivator, corn harvester, and corn husker and cutter, growing a corn crop is not so difficult as formerly. Potatoes are now cut by the use of implements, and potato planters, potato harvesters and potato "sifters" are no longer novelties. Even beans are now harvested by machinery, and the farmer's labor is being reduced to a minimum. Farmers frequently overstock themselves with sheep, and complain that they do not pay. They will not thrive if crowded, and this is a primary cause of disease. The aim should be to keep a small flock of good blood, and give those good feed, good shelter and close care. This will insure more and better wool and mutton than a larger flock kept under poorer conditions. Skim milk is too little valued as an accessory for stock feeding. Chemically considered, it contains all the elements necessary for the support of life and rebuilding the tissue. Young animals especially will use it to great advantage in combination with other foods, and there should be plenty of such kept on every dairy farm, so that this by-product could be employed to the fullest extent to supplement the profit. It is hard to get Flint corn to yield bushel for bushel of shelled grain as it comes in the ear. The eight-rowed kinds do it the best, but the ear is not too long and thick and the ear is well filled to its tips. But the deeper-grained Western Dent corn ought always to yield a bushel of grain for one of ears. If it does not it is a sign that the variety has high and is too late maturing to be of much value. Some of the earlier Dent varieties have very deep grains and a cob so small that a bushel of ears will make considerably more than a bushel of shelled grain. Some men seem to pride themselves upon the fact that they are practical farmers, and know nothing about agriculture except that which they have learned by hard knocks. But this is hardly as much credit to them as they seem to think, because the very best farmers in these latter days are the ones who combine theory with practice. A correspondent of the Royal New Yorker thinks that white-fleshed peaches are usually of better flavor than the yellow, and cling stones keep better and ship better than free stones. In other respects there is little difference between the different kinds. EVERYBODY'S COLUMN. Correspondence of Interest to the General Public.

Under this heading the RECORD-UNION will publish short correspondence on topics of interest to the general public. The matter in these communications will be understood to represent only the views of the writers. All communications must be accompanied by the name of the writer, not for publication unless so desired, but as a guarantee of good faith.—Eds.

The Sewage Disposal and Drainage Question. Eds. RECORD-UNION: I was very much pleased to see your criticism on my article published in the Bee a few days ago on the subject of sewers, etc. I have often wondered why some one did not say something in reply, either for or against my articles on the sanitary question as published by several papers of this city. I did not write my last article as presenting the best there is in the world for sewage purposes, but as the best that could be adopted for this city, as I thought. We certainly have not fall enough to carry the heavy part of the sewage off by gravity, consequently the plan I set forth in my article would be the next best thing to do, as I thought. I would leave it to you if four cesspools located in the alley in every block where they can be got at easily, are not better than forty or fifty in the same block, as at present, located where it is almost impossible to get to them and some of them not at all, consequently they go uncleaned for years and years, as you well say. There are yards in this city where cesspools have been dug and planked up; where one gets full it is abandoned and another dug, because it is cheaper than to clean the old one out. If the person you spoke of as complaining about cesspools would examine his premises and round about there, he would probably find from ten to fifteen cesspools in his vicinity. You will now see, if my plan should be adopted, that it would do away with all of this unsanitary condition of things. I said in my article (which you criticized so sharply, and rather sarcastically, as I thought) that your plan of sewers and sewage was the best, if it could be carried out successfully, but I did not believe it could be done; neither do I think now it can be done. If you can carry all the heavy matter from all the water-closets of this city four thousand feet, more or less, on a fall of only two inches to the hundred feet, you will do more than I think science or natural philosophy teaches. The fact is, with so little fall with this kind of sewage, the first you know a piece of paper or something else will catch upon a rough place on the sewer pipe, then another, and so on, until the pipe becomes full. What is to be done? Of course, the only thing that can be done is to blow out or flush out the pipes. This can be done on a short pipe, but I think you would find it rather troublesome in a large city like this to do so. I found it rather troublesome in a pipe about sixty feet long, where it was clogged something in the same way as set forth above. There was one thing I neglected to state in my article criticized by the RECORD-UNION, which is this: There is to be provided a drop-chamber at the end of the soil pipe where it enters into the cesspool. This will prevent all noxious gases from flowing back into the houses. This is a new invention by W. P. Kirkland of Gal, Cal. With this "excluder," how are noxious gases going to get back into our houses, as you seem to think they will? Something must be done, that is certain, and the sooner it is done the better; but first let us find out the best way to do it, then go to work and do it right. The greatest curse to this city is, and always has been, that we have to do things over so many times before we get them right. The plan that I have set forth is not money thrown away, as you suppose, but is absolutely needed; for surface and rain-water drainage the sewers we have now are nowhere near large enough to carry off the rain and waste water. How often do we see half the city nearly flooded with water from six to twelve inches deep, all because our underground sewers are so large enough to carry the water away? If my plan were adopted all of that trouble would be done away with, beside it would not cost one-half as much to take care of the streets and sewers as it does now, especially in the rainy season. There is a little sewer pipe being put in now on Seventeenth street, which is not one-quarter large enough to carry all the rain and waste water off from that section. I think you must know that our present sewers have not the capacity to carry off the atmospheric water, especially in the rainy season, to say nothing about all waste water. So you must see that my plan is the best for atmospheric drainage, so you will see that your system of disposing of sewage will have to come in later, if it can be done at all. N. D. GOODELL, Architect. Sacramento, October 30, 1893.

AMUSEMENTS. Mrs. Ward makes a charming Fanchon in the play of that name, and she won due credit for a pretty, a careful and an altogether satisfactory performance at the Clunie Opera House last night. Very many successes have been made in "Fanchon" these many years, and the memory of Maggie Mitchell and Alice Kingsbury is inseparably related to the piece, but Mrs. Ward also gives the idyl a personality in Fanchon that is artistic and very charming. Miss Milrin as Fadet did the best work she has done here. The disguise as the old man was complete, the reading full of feeling and spirit and the generous burst of applause it evoked must have been very flattering to the lady. It was a capital background to the pleasing figure Mrs. Ward sketched and made the work of the latter lady all the more prominent. Miss Milrin is to be congratulated on having created a very decided impression by her artistic effort. Mr. Birch was the Laury of the play and let nothing to be wished for in that role. Mr. McCurdy as Dillier, the twin, gave him excellent support, and a little too much exaggeration in the intellectual weakness of the soft-headed lad. He cannot afford to reduce the character to the level of buffoonery, which he came very near doing. The play was well acted. The setting by Parker was a decided credit to stage carpentering skill, and the new scenery by Duran was very happy. The set in the festival scene was notably well painted. The play will be repeated to-night. Arrangements have been made for a late train Saturday night next, so that the last performance of "The Span of Life" at the Metropolitan Theater that night may be as full and complete as on Friday night. LOTTERY JOINTS RAIDED. Deputy Sheriff Hendricks Had a Lively Evening. Deputy Sheriff Hendricks distinguished himself last night by raiding a Chinese lottery game in the rear of Max Ginsberg's fruit stand on J street, near Fourth. He had become satisfied that there was a "joint" in there, and had a man go in to buck at the game. When Hendricks attempted to enter the rear room the proprietor of the fruit stand tackled him, and they had it in pretty lively fashion for several minutes. They tumbled about over fruit and tobacco boxes, and from the street it looked as if a modern football game was in progress. In the meantime the man who went in ostensibly to play at the lottery had made a prisoner of the Chinaman, one Lee Hong, while one genuine customer made his escape. Hendricks took the Chinaman to the County Jail and locked him up, after confiscating the lottery tickets and some \$12 in cash. Then he raided another joint on Eighth street, where he danced an Orville jig on the Chinaman's outfit, and when he got through the place looked as if a cyclone had passed through it. Later in the evening while Deputies Johnson and Hendricks were in a barber-shop on K street a Chinaman entered and tried to sell a lottery ticket, and he too was run in. The officers complain that the Police Court is too lenient with these Chinese gamblers, and that the low fines imposed have no restraining effect on them whatever. The Rattlesnake's Rattle. The growth of the rattle of the rattlesnake has been studied by a German scientist, who finds that the rattle is frequently shed; and after being shed the snakes were kept in a very warm room, in three or four months two rattles were present, their appearance having nothing to do with the casting of the skin. The snakes were made to register the vibration of the rattle on smoked paper, and it was found that the vibration was a compound one, consisting of the vibration of the tail as a whole, and of the rattle independently of the tail vibrations. The approximate figures of vibrations were, for the tail, 75; of the rattle, 110 a second.
