A. THOMPSON.

QUEEN BEES AND HOW THEIR VACANCIES ARE SUPPLIED.
In a paper read at the Microscopical Club, Mr. Hunter states that a fertile queen bee will in four years lay a million eggs. Twenty-one days are required for the production of a worker bee; but the same egg that produced the worker in twenty-one days could, had the bees been so minded, have been bred up to a queen when necessity calls for them, either from loss of either from loss of their old monarch or apprehended swarming. If I remove a queen from a hive, the first of these contingencies occurs, and after a few hours' stir, the bees select certain of the worker eggs, or even young larvæ two or three days old. The cell is enlarged to five or six times its ordinary capacity, a superabundance of totally different food is supplied, and the result is that, in five days less than would have been required for a worker, a queen is hatched. The marvel is inexplicable. How a mere change and greater abundance of food, and a more roomy lodging, should so transform the internal and external organs of any living creature! The case is without a parallel in all the animal creation. It is not a mere superficial change that has been effected, but one that penetrates far below form and structure, to the very fountain of life itself. It is a transformation alike of function, of structure, and of instinct.—*Es.*

HOW TO CUT THE NECK OF A BOTTLE.—With a strong twine, a yard or less in length, make one turn around the neck, rapidly move the bottle from one end of the string to the other, so that the friction may heat the part; while hot, dip in cold water, and the glass is chipped off as clean and smooth as if cut by a diamond.

TO KEEP CLEAR OF BED BUGS.—Take the white of four eggs, ten cents worth of quicksilver; put them in a bowl and beat them to a perfect froth. Take a feather and dip it in this preparation, and apply it to every part of the bedstead where bugs conceal themselves. Do this once a year, and you will never see a bed bug in your house.

A farmer writing to an exchange says: "I had a mare some years ago that had a large wart on her side, where the harness rubbed and kept it sore. In summer the flies made it worse. To prevent this I put on a good daub of tar, and in a few weeks the wart was killed and disappeared. I have frequently tried it since on cattle and horses, and seldom had occasion to make a second application. The remedy is simple and effectual."

GIVING A PIG MEDICINE.—At a recent meeting of an English farmers' club, Prof. McBride spoke of the difficulty of administering medicine to a pig. He said: "To dose a pig, which you are sure to choke if you attempt to make him drink while squealing, halter him as you would for execution, and tie the rope end to a stake. He will pull back until the rope is tightly strained. When he has ceased his uproar and begins to reflect, approach him, and between the back part of his jaws insert an old shoe, from which you have cut the toe leather. This he will at once begin to suck and chew. Through it pour the medicine, and he will swallow any quantity you please."
