IN GEORGETOWN DISTRICT

Geology of the Section Written for the Engineering and Mining Journal.

The Famous Cable Yielded More Than a Million in Its Time.

The District is Situated Not Far From Phillipsburg—The scene of Past Placer Work.

The latest issue of the Engineering and Mining Journal contains an article written for that publication on the Georgetown mining district, of Montana. It is as follows: "On Professor Hitchcock's geological map of the United States there is shown a belt of Archaean rock, reaching from 117 degrees west longitude, on the northern edge, is a southeasterly direction, so that it crosses the 47th parallel at 115 degrees, and the 45th at 113 west longitude. Between these two intersections a tongue of granite, scarcely five miles wide, darts to the northeast perhaps 50 miles, into the heart of the Paleozoic rocks, which are shown on the map referred to as 150 miles wide at this point. Closely west of this granite tongue is the old gold camp of Georgetown, Mont., 18 miles northwest from Anaconda, and 12 miles southeast of Phillipsburg.

The district lies at the mouth of the gulch on the eastern skirt of Georgetown Flat, a great expanse of meadow, plentifully watered and sometimes swamped by streams and springs. The gulch is the scene of past placer work, and its gravel has been many times turned over. Across the head of it lie the Pyrenees and Niantic claims, on which the deepest work of three miles has been done. The shaft on these claims—they are under one ownership—is 300 feet deep and reaches base ore, a pyrite, with quartz and barite gangue. The property was a good producer until the increase of the sulphides rendered the old stamp useless.

But to return to the geology of the region. The road from Anaconda runs up Warm Springs canyon; this is a deep gash in much altered limestone, showing moderate contortions of stratification, which are to be easily traced by the casual traveler in the dark lines of the coal measures. The base of black or gray in strong contrast with the light limestone. Here and there along the canyon there has been a good deal of prospecting, and several silver lead deposits have been worked in a desultory fashion, with co-ordinate results. At Cable, two or three miles southeast of Georgetown, the road has left the Paleozoic limestones for the Archaean tongue of granite referred to above, which it exchanges again for limestone above Georgetown. Georgetown, then, is on limestone; and the Pyrenees, half a mile above it, in granite, of an undetermined variety. Striking diagonally up the hill to the right and obliquely across the gulch, is the line of contact. It is marked by a deposit of brown iron ore, reaching a width of 40 feet or more. In which large boulders of a limestone occur. This ore is of the familiar "burnt" appearance, and barren so far as developed, which has been done in many places and to respectable depths.

The Pyrenees vein—and it stands for the others in the granite so far as they are explored—is a fissure, to use a familiar, if misleading, term, with characteristics of gangue on footwall, local pinches and bonded structure. There are several local bonanzas four, eight or ten feet thick, but the width averages over three feet. Its strike is such as to cause an intersection with the contact to the south, where the vein is not cut off in that direction by a vertical, dyke-like mass of limestone, reaching up from the limestone country; beyond this it has not been determined. This is a brown iron ore with stained quartz, the base ore pyrite with barite and quartz gangue. An interesting fact to be noticed with reference to the free milling and base rock is that the line of change borders upon the vertical, with a slight dip toward the lime dyke, so that this dyke must be a drainage from the mountain. Closely grouped with these claims are others, on all of which considerable prospecting has been done, resulting in some shipments of ore; but in the Pyrenees alone has base rock been reached.

Another important mine of the district is the Southern Cross, three-quarters of a mile from Georgetown and a mile from the Pyrenees. This is on the lime side of the contact. It has been opened to 250 feet and shows a considerable ore body, but falls of the character of a fissure, seeming rather to be a chamber of oxidized iron in limestone and largely contaminated with the country rock. Considerable trouble has been experienced in the treatment of this ore, both milling and a modification of the cyanide having proved unsatisfactory. Grouped with the Southern Cross are the Oro Fino, North Atlantic and others, of identical character, but behind it in point of development. The Oro Fino is considered the most promising of these, and recently a run has been made on its ore in the Cameron mill. It is through this mill, which lies down the hill from the Southern Cross, that the greater part of that mine's ore has been run and here that the cyanide process was attempted.

These mines are all on the southwest slope of Cable mountain, on another flank of which and a mile to the eastward is the famous Cable mine, named for the Atlantic cable, which was laid in the year of its location. This mine is outside of the limits assigned to the present article, but a word or two concerning it will not be uninteresting. The cable ore occurs in a dyke of limestone 100 to 300 feet thick, which is, in turn, contained in granite. The ore was found—the mine has been idle several years—as chambers of pyrite and galena, which were prospected for with the diamond drill. The ore, though bare, milled freely. The mine has been phenomenal as a producer of gold specimens, one particular mass having sold for several thousand dollars. But, beyond this, it was a steady producer up to the time of its closing down, its output having exceeded a million dollars.

Southwest of the Pyrenees and south of Georgetown, on the point of the ridge that swings around toward the flat, is one other deposit of geological interest from its uniqueness in the region. This is a deposit of honey-combed, slightly stained quarry, frequently in crystals. It has as yet but a geological interest, but a word is accentuated by the occurrence of deposits of the normal character near by. One silver-lead property, the Ontario, has been partly developed in the flat, but great quantities of water forced suspension of operations.

What Joyful Feeling With the exhilarating sense of renewed health and strength and internal cleanliness, which follows the use of Syrup of Fig, is unknown to the few who have not progressed beyond the old time medicines and the cheap substitutes sometimes offered but never accepted by the well informed.

The best dollar underwear in the city for ladies at The Bee Hive.

HELENA FOR THE CAPITAL.

Believing the discussion of the location of the permanent seat of government to be of the greatest consequence to the citizens of Montana, in behalf of the citizens of Helena we offer to meet in joint discussion any gentleman who may desire to advocate the claim of Anaconda. The following gentlemen will address the voters in behalf of Helena:
