MOUNTAINEERS CLIMB

PERILS OF MT. RAINIER.

Continued from third page.

the climbers must pick their way in their effort to reach the summit. Carbon and White glaciers, the latter one of the largest on the mountain, are certain to afford obstacles. The difficulty lies in picking a route across the ice fields that is not broken by crevasses. Once across the glaciers there will remain only a straight, hard climb to the summit.

As a supplement at the end of the main climb a selected group of the Mountaineers will make around the sides of Rainier the most remarkable trip ever undertaken on the mountain. Their object will be to travel completely around the mountain, starting from the scene of the ascent on the north side, going eastward around to Paradise Valley on the south, thence to the famous Indian Henry's Hunting Ground, on the western slope, and back to the starting point. The journey will be made by expert mountaineers, and they will be obliged to carry their supplies and blankets on their backs. Almost all of the twenty glaciers on the mountain's side must be crossed, and the dangers will be numerous, especially if bad weather should be encountered when the party is miles away from any base of supplies. This, if successful, will be the first complete circumambulation of the mountain, and should be of great value, from a geographical and scientific standpoint, as even the best government maps are incomplete and
