**WHEELING COTTON MILLS.**

Yesterday morning we visited the Wheeling Cotton Mills, which have been idle for two years and more, until recently put in operation by Mr. T. W. Gillis, an enterprising gentleman from the east, who possesses a perfectly practical knowledge of all the minutia of the business. We found the machinery, which two years of idleness had somewhat disordered, thoroughly brushed up, and almost as good as new. The clatter and clanging of the spinning wheels, pickers and drawers, reminded us of a business thrif and prosperity that was very gratifying to witness in Wheeling's palmist days. Only a few weeks ago the lofty and many-windowed structure, in its perfect stillness was suggestive of ghosts and haunted crevices. Now all its life and bustle and active energy. Everything in the vicinity seems to feel the change.  
The process through which the cotton passes in a factory of this kind is not generally understood, and we therefore attempt to describe it, and find ourselves materially assisted by a familiar Cyclopaedia before us. After the cotton has been ginned on the plantation, picked and separated into a light uniform mass, the first operation is carding, which serves to equalize the substance of the cotton, and dispose its fibres in a parallel direction. The carding-engine consists of a revolving cylinder, covered with cards of iron wire, which is nearly surrounded by a fixed concave framing, also lined with cards, with which the cylinder comes in contact.  
From this cylinder, called the breaker, the cotton is taken off by the motion of a transverse comb, called the drafting-plate, and it passes through a second carding in the finishing cylinder. It is then passed through a kind of funnel, by which it is contracted into a narrow band or sliver, and received into tin cans, in the state of a uniform continued carding.  
The next step in the process is called drawing the cotton. The machine employed for this purpose, called the drawing-frame, is constructed on the same principle as the spinning-frame, or jenny, from which the idea of it was taken. To imitate the operation performed by the thumb and finger in hand-spinning, two pairs of rollers are employed; the first pair, slowly revolving in contact with each other, are placed at a little distance from the second pair, which revolve with greater velocity. The lower roller of each pair is furrowed or fitted, longitudinally, and the upper one is covered with leather, to give the two a proper hold of the cotton. If a carding be passed between the first pair, it will be merely compressed by the pressure of the rollers; but, if it be then passed through the second pair, moving with twice or thrice the velocity of the first, it will be drawn twice or thrice smaller than it was when it entered the first rollers. The relative velocity of the two pairs of rollers is called the draught of the machine.  
Several of these drawings are then passed together through rollers, in the same manner, plying (coalescing) as they pass, and forming a single new drawing. The drawing and plying are several times repeated, and have the effect of arranging all the fibres of the cotton longitudinally, in a uniform and parallel direction, and doing away all the inequalities of thickness. In these operations the cotton receives no twist.  
Roving the cotton, which is the next part of the process, gives it a slight twist, which converts it into a soft and loose thread, called the roving. The machine for performing this operation is called the roving-frame or double-speeder. In order to wind the roving upon the bobbins of the spindles, in even cylindrical layers, the spindle-rail is made to rise and fall slowly, by means of heart-wheels in the interior of the machine. And, as the size of the bobbins is augmented by each layer, the velocity of the spindles and of the spindle-rail is made to diminish gradually, from the beginning to the end of the operation. This is effected by transmitting the motion to both, through two opposite cones, one of which drives the other with a band, which is made to pass slowly from one end to the other of the cones, and thus continually to alter their relative speed, and cause a uniform retardation of the velocity. The bobbins are now transferred to the spinning-frame, which has a double set of rollers, like those described in the account of the roving-frame, and which, operating in the same manner as in those machines, extend the rove, and reduce it to a thread of the required fineness by flyers, driven by bands, which receive their motion from a

**WHEELING COTTON MILLS.**

horizontal fly-wheel, or from a longitudinal cylinder. The process of stretching is intended to produce threads of the finest kinds, and consists in forcibly stretching portions of yarn, several yards long, in the direction of their length. The purpose of it is to reduce those places in the yarn which have a greater diameter than the rest, so that the size and twist of the thread may become uniform throughout.  
The Wheeling Cotton Mills, Mr. Gillis informs us, is now capable of making one million yards of brown muslin, and about three hundred thousand yards of batting twine, &c., annually, which is worth not less than one hundred thousand dollars. A small improvement proposed soon to be made, will almost double the capacity of the mill, at a comparatively trifling cost. The mills will consume about fifteen bales, or seventy-five hundred pounds of cotton per week. The establishment will have work for about eighty hands and the payroll for the same will be somewhat less than two thousand dollars per month.  
Wheeling possesses many advantages as a point for the manufacture of cotton goods. She is convenient to a Market for the raw material, and also to a market for all her products, some of which are sold at good prices to our wholesale dry goods houses here, whilst others are shipped to the south and west. To show the advantages possessed in the matter of ready sales, one house in Nashville has agreed to receive all the goods from the Wheeling Cotton Factory, which the manufacturer does not sell for cash. Besides this, the power employed here is cheaper than the water power of Lowell and Manchester, and this point also possesses advantages in cheapness of freight on the raw material. To conclude, we are satisfied with the few observations made, that the Wheeling Cotton Factory, under its present enterprising management, will prove abundantly successful.  
AN INEXANT BABOON.—The following curious account of a baboon family is translated from a recent French work, by M. Boitard, for Goodrich's "Illustrated natural History."  
There have been, and still are, in the menagerie of the Garden of Plants, Paris, a number of baboons, and four years ago, a female, who had a young one, furnished one of the most amusing and singular spectacles ever witnessed. She was placed with it in a cage, near the one formerly occupied with several other animals of the same species. The infant baboon was hideously ugly, but she lavished upon it the most tender caresses. When it was eight days old, the door of communication was opened, and her male entered. The mother, seated in the middle of the cage, held the young heir in her arms, precisely as a nurse would do under similar circumstances. The happy father approached and embraced his mate with French gallantry upon each side of the face; he then kissed the little one, and sat down opposite to the mother, so that their knees touched each other. They then both began to move their lips with rapidity, taking the young one from each other in turns, as if they were having a most animated conversation concerning it. The door was again opened, and the baboon friends entered, one after another, each embracing the mother, who, however, would not allow them to touch the young one. They seated themselves in a circle and moved their lips, as if felicitating the happy couple on the arrival of the son and heir, and perhaps finding in it a marvelous resemblance to either the father or mother. This scene was very much like that which often takes place in the domestic life of human families, except that the mother, on similar occasions, does not manifest so similar felicitations were more hearty, and genuine on the part of the brutes than on that of their more favored prototypes.  
"All the baboons wished to greet the young one; but no sooner did one of them put forward his hand than a good slap from the mother warned him of his indiscretion. Those who were placed behind her, stretched their lips out shyly, slid it under her arms, and succeeded in obtaining their great joy, in touching the little one with their mother perceiving it, particularly when she was engaged in conversation. But a smart correction soon taught them that their indiscretion was observed, and they quickly retreated. It was evident that the monkey mother, thoroughly acquainted with the requirements of her position, knew perfectly well how to divide her attention between her guests and her infant charge."

**THE WHOLE NORTH LABELLED.**

[From the Providence, R. I. Journal.]  
The majority of the people of the Northern States of the Confederacy are of the Republican party. The preponderance extends through all classes of people. Men of business, working men, scholars and professional men, of all these the majority are Republicans. Without denying equal honesty and good faith to the men of all parties, it will be admitted that the Republicans are not behind their fellow-citizens generally, in intelligence, probity and patriotism; that they have adopted the principles which, in their deliberate judgment, are best calculated to advance the public good, and that they mean to support those principles in a manner that is consistent with the duties and obligations of good citizens. Whatever rabid politicians may say, we think that no candid man will deny this.  
And, we are told, and by newspapers published on our own soil, that the Republicans have indignately and perpetually recent atrocious folly and wickedness at Harper's Ferry; we are told that it is for such violence as this that the Republican party has been organized, and that it is carried on with a view to just results; we are told in effect, and by Northern papers, that a majority of the Northern people are incendiaries and murderers; that you and I—we who write these words and you who read them, that the men who fill our white hats, the men who in all the Northern States have been chosen to the most responsible offices, and who have received the highest marks of the public confidence and favor, are all of a base and assassin; and that the object of all these is to ravage the southern portion of the confederacy with fire and sword. Could there be a stronger evidence of the shameful extent to which partisan malevolence can bear men against their neighbors and fellow citizens and of the unscrupulous manner in which everything is perverted to the use of party?

**WHEELING COTTON MILLS.**

horizontal fly-wheel, or from a longitudinal cylinder. The process of stretching is intended to produce threads of the finest kinds, and consists in forcibly stretching portions of yarn, several yards long, in the direction of their length. The purpose of it is to reduce those places in the yarn which have a greater diameter than the rest, so that the size and twist of the thread may become uniform throughout.  
The Wheeling Cotton Mills, Mr. Gillis informs us, is now capable of making one million yards of brown muslin, and about three hundred thousand yards of batting twine, &c., annually, which is worth not less than one hundred thousand dollars. A small improvement proposed soon to be made, will almost double the capacity of the mill, at a comparatively trifling cost. The mills will consume about fifteen bales, or seventy-five hundred pounds of cotton per week. The establishment will have work for about eighty hands and the payroll for the same will be somewhat less than two thousand dollars per month.  
Wheeling possesses many advantages as a point for the manufacture of cotton goods. She is convenient to a Market for the raw material, and also to a market for all her products, some of which are sold at good prices to our wholesale dry goods houses here, whilst others are shipped to the south and west. To show the advantages possessed in the matter of ready sales, one house in Nashville has agreed to receive all the goods from the Wheeling Cotton Factory, which the manufacturer does not sell for cash. Besides this, the power employed here is cheaper than the water power of Lowell and Manchester, and this point also possesses advantages in cheapness of freight on the raw material. To conclude, we are satisfied with the few observations made, that the Wheeling Cotton Factory, under its present enterprising management, will prove abundantly successful.  
AN INEXANT BABOON.—The following curious account of a baboon family is translated from a recent French work, by M. Boitard, for Goodrich's "Illustrated natural History."  
There have been, and still are, in the menagerie of the Garden of Plants, Paris, a number of baboons, and four years ago, a female, who had a young one, furnished one of the most amusing and singular spectacles ever witnessed. She was placed with it in a cage, near the one formerly occupied with several other animals of the same species. The infant baboon was hideously ugly, but she lavished upon it the most tender caresses. When it was eight days old, the door of communication was opened, and her male entered. The mother, seated in the middle of the cage, held the young heir in her arms, precisely as a nurse would do under similar circumstances. The happy father approached and embraced his mate with French gallantry upon each side of the face; he then kissed the little one, and sat down opposite to the mother, so that their knees touched each other. They then both began to move their lips with rapidity, taking the young one from each other in turns, as if they were having a most animated conversation concerning it. The door was again opened, and the baboon friends entered, one after another, each embracing the mother, who, however, would not allow them to touch the young one. They seated themselves in a circle and moved their lips, as if felicitating the happy couple on the arrival of the son and heir, and perhaps finding in it a marvelous resemblance to either the father or mother. This scene was very much like that which often takes place in the domestic life of human families, except that the mother, on similar occasions, does not manifest so similar felicitations were more hearty, and genuine on the part of the brutes than on that of their more favored prototypes.  
"All the baboons wished to greet the young one; but no sooner did one of them put forward his hand than a good slap from the mother warned him of his indiscretion. Those who were placed behind her, stretched their lips out shyly, slid it under her arms, and succeeded in obtaining their great joy, in touching the little one with their mother perceiving it, particularly when she was engaged in conversation. But a smart correction soon taught them that their indiscretion was observed, and they quickly retreated.
