FARM AND GARDEN

DWARF FRUIT ORCHARD.

Professor F. A. Waugh's Novel and Successful Enterprise.

One of the subjects relating to horticulture which demand deserved attention is the experiment of Professor F. A. Waugh of the Massachusetts Agricultural college in the production of dwarf fruits. The one-fourth acre dwarf fruit orchard there fruited heavily.

DWARF APPLE TREES IN FRUIT.

(The kind they grow in Massachusetts.)

ily last season. An editorial representative of the New England Homestead inspected the orchard when it was in fruit and found the enterprise an unqualified success. All of the common fruits, such as apples, pears, plums, peaches, nectarines, etc., were found in the dwarf fruit garden. Fine large apples were seen growing on trees not half as tall as a man. The fruit in some instances was within two or three inches of the ground. In the case of pears the trees were about as high as one's head, and the limbs were literally loaded with delicious fruit. The peaches, too, were bearing heavily, and the close planting did not seem to injure the quality of the fruit.

In Professor Waugh's opinion dwarf apples are the most interesting and valuable of dwarf fruits. Of the forms under which they may be cultivated the simplest is the bush or vase form. They succeed very well as upright cordons and all the simpler modifications of this form. As the trees can be planted very close together (easily as close as fifteen inches), thus occupying very little room, a large number of them can be planted in very limited areas of the city lot or back yard.

The apple adapts itself admirably to horizontal cordons. Dwarf apples require practically the same cultivation and care as standard apples. The soil should be cultivated the early part of the summer and allowed to rest the latter part of the year. Cover crops may be sown during June or July, according to the custom in the usual orchard management. Practically all varieties of apples can be grown as dwarfs, though some succeed better than others.

APPLES IN UPRIGHT CORDONS.

(As grown at Massachusetts Agricultural college.)

cording to the custom in the usual orchard management. Practically all varieties of apples can be grown as dwarfs, though some succeed better than others.

Live Stock Farming.
One important factor of live stock farming should not be overlooked in considering this outlet from the single crop cotton growing system. Should any particular class of live stock become unprofitable the forage crops produced on the farm could be used for another class of stock, and the labor which had been trained to care for one class would find it comparatively easy to undertake the management of stock of any other kind.—W. J. Spillman.

Profit in Raising Mules.
In the south a well broken young team of mules will bring from \$400 to \$500 and a pair of unbroken yearlings from \$250 to \$350. It is claimed that \$25 will freely cover the cost of raising a mule colt to a yearling and that \$90 will raise a two-year-old. From these figures it is easy to prove that there is much profit in raising mules.—Farm Journal.

Looking Into Past and Future.
As we look over the past year and take note of its conditions and of our own experience, we should be able to note wherein we might have done better. He is a wise and practical person who is willing to profit by mistakes to the extent of changing his views and practices for what appears to be the better.

Manure in Cold Climates.
Many experiments, notably those made by the Michigan and Wisconsin stations in this country, have shown that barnyard manure is one of the most effective means of increasing the productivity of swamp or muck soils. This is thought to be due largely to the increase of available nitrogen brought about by the application of the manure. In cold climates, where the season is short and the conditions for rapid fermentation in the soil unfavorable, the use of fermented manure is preferable.—W. H. Beal.

Growing Fruit in Nebraska.
Not only is there no question about the water supply in western Nebraska as long as the rivers run, but soil cultivation is easier than under ditch irrigation. Not only is the elevation less than some of Colorado's most famous fruit districts, but the climate is at least equal to and very little different from that of Colorado. Cool nights, ample moisture and bright sunshine all combine to give the high coloring and fine quality which have made Colorado fruit famous. Western Nebraska has all of these.—E. F. S. in Orange Judd Farmer.

TOBACCO CULTURE.

The Bulk Method of Fermentation.

Effects of Fertilizers.

Investigations for the improvement of tobacco in Texas, Alabama, Ohio, Virginia and Connecticut are being continued by the department of agriculture. According to the annual report, satisfactory evidence has been secured that the tobacco produced in Texas meets the requirements of the trade as a high class domestic filler. A ready market has been found for the filler leaf produced in Alabama, the product being similar in quality to the Texas and Florida leaf. The work of introducing the bulk method of fermentation in Ohio has been continued, and the method prescribed by the bureau has been applied to over 25,000,000 pounds. It has been demonstrated in Virginia that by the use of carefully selected fertilizers the profits in growing tobacco can be considerably increased, and the accumulative effects of fertilizer and cultural methods give highly significant results. In the Connecticut valley the work of producing under shade a wrapper leaf having all the qualities demanded by the trade is being continued in connection with the breeding experiments conducted by the bureau of plant industry.

The tobacco breeding experiments have proved especially successful, new sorts having already been planted by tobacco savers and are giving excellent results. The tobacco breeding experiments are being extended to the Ohio and Virginia, with the promise of results as important as those in Connecticut and Florida.

MOSS IN PASTURES.
Sodium Nitrate Is Found to Be an Effective Remedy.

The moss knolls so common in our pastures are composed mainly of Polytrichum commune and less often of a closely related species, Polytrichum juniperinum. A pasture belonging to the Vermont experiment station and considerably infested with moss was used in these experiments. Three plots, containing 100 square feet each, were measured off and lime, maple wood ashes and sodium nitrate applied at the rate of 5,000, 1,000 and 1,000 pounds respectively. Made application also on three plots containing ten square feet at the same rate, but worked into the soil. These materials were applied about Nov. 15, 1905, and about June 1 of the following year some sections had already taken place. Plot No. 1, containing lime as a top dressing, was little affected. Plot No. 2, containing ashes as a top dressing, was little affected, except in those spots where the ashes happened to be particularly thick, in which places the moss was unhealthy and in some cases dead. Plot No. 3, containing sodium nitrate as a top dressing, was greatly changed. More than half the moss was killed, and the greatly increased growth of grass bid fair to drive out the rest. The three tilled portions were also considerably less acid, although not alkaline in reaction. The effect of lime when used as a top dressing is well known to be slow, and consequently later results may prove more favorable. This action shows how much the mosses are dependent on a certain kind of habitat in order to thrive and suggests the practicability of using the nitrate on lawns, etc., that are infested with mosses. In any case the better and more luxuriant grass produced would usually more than pay for the cost of trouble of application, concludes a writer in American Cultivator. Nitrate of soda is a salt extremely easy to apply and with scarcely any smell. Its solubility and quick action make it especially effective during a rainy season.

BIBLE BRILLIANTS.

Blessed is that servant, whom his lord when he cometh shall find so doing.—Matthew xxiv, 46.

For ye shall be as a garden that hath no water.—Isaiah i, 30.

He sent redemption unto his people: he hath commanded his covenant for ever: holy and reverend is his name.—Psalm cxi, 9.

And all they that heard them laid them up in their hearts, saying, What manner of child shall this be! And the hand of the Lord was with him.—Luke i, 66.

Their land also is full of silver and gold, neither is there any end of their treasures; their land is also full of horses, neither is there any end of their chariots.—Isaiah ii, 7.

And I gave my heart to seek and search out by wisdom concerning all things that are done under heaven: this sore travail hath God given to the sons of man to be exercised therewith.—Ecclesiastes i, 13.

That he would grant unto us, that we being delivered out of the hand of our enemies might serve him without fear, in holiness and righteousness before him, all the days of our life.—Luke i, 74-5.

And thou, child, shalt be called the prophet of the Highest; for thou shalt go before the face of the Lord to prepare his ways; to give knowledge of salvation unto his people by the remission of their sins.—Luke i, 76-7.

He hath put down the mighty from their seats, and exalted them of low degree. He hath filled the hungry with good things; and the rich he hath sent empty away. He hath holpen his servant Israel, in remembrance of his mercy.—Luke i, 52-54.

Wise Counsel From the South.

"I want to give some valuable advice to those who suffer with lame back and kidney trouble," says J. R. Blankenship, of Beck, Tenn. "I have proved to an absolute certainty that Electric Bitters will positively cure this distressing condition. The first bottle gave me great relief and after taking a few more bottles, I was completely cured; so completely that it became a pleasure to recommend this great remedy." Sold under guarantee at all drug stores. Price, 50 cents.

Dr. E. G. Allen, of Shreveport, announces that he has opened an office in the Cooper Building. Dr. Allen is a graduate of both schools and carries a full line of homeopathic remedies. Special attention given chronic diseases.
