Bowman's

DEPEND ON BOWMAN'S FOR EVERY AUTUMN NEED

MEN!

Our Clothing Message for
To-morrow Is

\$12.50

An important message, too; for it tells of a value in suits and overcoats that every man should consider to his advantage to investigate.

\$12.50 is a Low Price for a good suit—a genuinely good suit.

And this is our standard of Good Clothes:

- A reliable grade of wool fabric.
- Important parts tailored by hand.
- Assurance of correct style and satisfactory fit.
- Well finished.

Our \$12.50 suits and overcoats measure up to this standard in every respect.

Young men in particular note this.

BOWMAN'S—Second Floor.

New Bags for Autumn are many and varied, as you may judge with prices ranging from **50¢ to \$8.00.**

Main Floor.

Millinery in a Revelation of Correct and Becoming Styles

Go through our entire assemblage if you please, and note how each hat represents an idea carefully worked out.

Note, in particular, how every hat bespeaks of late creation; how the thought of the moment reflects through every style.

Note also the exclusiveness. Not a hundred-and-one of the same style. In all, it is a splendid variety.

Untrimmed Shapes

Are plentiful in most stylish models.

You might expect to find most any size among the large assortment, and to be in style you need only select the most becoming.

Velour Sport Hats

Are the "big hit" of the present moment and we are showing them in various colors and shapes.

And may we show you how moderate our prices are?

BOWMAN'S—Third Floor.

EDUCATING THE GIFTED CHILD

By Frederic J. Haskin

[Continued From Editorial Page.]

of swimming and other out-door sports. If she had not been permitted to attend this private school she would have lost two full years at the most important period of her life because the public school of her city made no provision for her exceptional mentality.

Many Such Cases Found

In every city such cases are found and educators are at last recognizing the economic waste of retarding the gifted child to make him fit into a course of study designed for the ordinary child. Much time and money have been spent upon the development of the backward child. Special teachers have been provided in the attempt to bring him up to normal standards. The supernormal, or gifted child, who has long been recognized in Germany and other European countries as a nation's most valuable asset, has been neglected in this country, and his special talents wasted and ignored.

For several years consideration has

been given to this matter, and this Fall in most large cities special classes will be opened for the supernormal child in which he will be under the direction of special teachers who will aid rather than retard his advancement. This work will be experimental at first and cannot be expected to meet all the needs, although it is the beginning of an educational reform.

Psychologists divide school children into three classes: supernormal, bright or gifted; normal or average; and backward, subnormal or deficient. All courses of study were planned for the normal child who naturally represents the greatest number. Santa Barbara, Cal., has recently employed the Binet test to gauge the school children of that city. According to that, 22 per cent. of school children were supernormal, 44 per cent. normal and 34 per cent. subnormal in varying degrees.

This proves that the present system of inflexible grading is just only to 44 per cent. of the school children. The old country school gave far greater advantages to the gifted child than the best equipped city institution. The boy who learned the multiplication table by hearing other children recite it, was not kept back until the most stupid student in the class had mastered it. He was allowed to

forge ahead for himself and if he "figured clear through the 'rithmetic'" that term he was encouraged by his teacher. It frequently happens that a country boy transferred to the city school will be several grades ahead for his age, because of the individual liberty he has been allowed.

Divided Into Two Classes

The supernormal children are divided into two classes: The first class shows exceptional brightness upon all subjects. The other may be only normal as regards most subjects, but will exhibit one or two special gifts or talents. The education of one of these classes differs materially from that of the other. The special talent may be in a single direction and need broadening to render it of greatest practical value. The child with a special gift, such as music or art, should not have that gift so highly developed at the expense of his other

faculties that he requires a commission to feed and care for him when he has arrived at maturity. Psychologists claim that the impractical tendencies of genius are entirely due to lack of general education. The well-rounded education, which develops the intellect as a whole, will not detract from the special gift. It is more likely to strengthen it because all the faculties are made stronger.

A number of other gifted children are now in the limelight as examples of the possibilities of judicious education. Herbert Weiner, who recently received the degree of Doctor of Philosophy at eighteen, graduated from Tufts College at the age of fourteen. Three younger Weiner children, now being educated after the same methods, are expected to distinguish themselves equally. William James Sidis, who entered Harvard University at eleven and a year later delivered a

lecture upon the Fourth Dimension, the most abstruse problem in mathematics, is the son of Dr. Boris Sidis, a specialist in mental and nervous diseases. Dr. Sidis takes the stand that disease and nervousness result from worry, emotional excitement and lack of interest in the work at hand rather than from undue study.

"We do not teach children anything in infancy for fear of over-developing their brain," said Dr. Sidis in a recent address, "when in reality the brain, like the body, gains strength and health from use. After the child's natural interest has been dulled and his brain rendered less active than nature intended, because it was not used in the beginning, we put him in school and confront him with a heterogeneous collection of facts which do not interest him. We force him to study. We cram him and feed him and stuff him like a goose. We expect

him to pass his examinations and blame him if he fails. This produces the worry which injures the health. It might be avoided by well regulated study at an earlier age."

LUXURIOUS BIG GYPSEY VAN ON CROSS-COUNTRY TOUR

What is probably the most elaborate prairie schooner that ever started on a transcontinental trip in this country recently left Long Island bound for San Francisco with a party of nine persons. It is a large, double-decked, richly appointed motor bus which was built especially for this tour by a New York financier.

The interior of the car is 21 feet in length, 7½ feet wide and 6½ feet high. The space is divided into three compartments. The first of these is occupied by two chauffeurs and is a

roomy vestibule which almost in a moment's time may be converted into a very comfortable bedchamber. Back of this is the main room, some 10 feet in length. The arrangement of this is much like that of a Pullman car. During the daytime it is used as a living room, while at night, with its six berths made up, it offers nearly the same conveniences as are afforded on a well-equipped overland express. There are electric lights, hot and cold running water, shower baths and other similar accommodations. The room is fitted with upholstered furniture, has a library and writing desk, boasts a talking machine, and is shaded by broad awnings. Back of this compartment is an electric kitchen, in which is built a compact refrigerator. Several views of this unusual machine are published in the October Popular Mechanics Magazine.
