

OPENING GREAT BEAVER COPPER BELT

Cactus Leads All in Development of Sensational Bodies of Rich Ore.

Blackbird, Imperial, Comet and Others Also Make Splendid Showing and All Likely to Become Big Producers.

Great sums of money have been expended in the development of the Beaver county during the past twelve months and much in the way of proving the worth of the mines has been accomplished. The management of the Newhouse Cactus property has demonstrated that the mine is worth easily twice as much as the estimates placed upon it one year ago, when the amount of ore blockaded was estimated at more than \$5,000,000, and for all that the ground has hardly been scratched as yet. The operation of the Majestic company's smelter has shown that the company has ore in its veins when properly developed, can be relied upon to provide big dividends, and the fact must lend encouragement to the companies and individuals owning other properties along the great copper belt in that county. Internal dissension in the Majestic company has had the effect of placing a damper on the exploitation of new enterprises through the creation of a suspicion that the cause rested in the properties themselves. With the phenomenal success of the Cactus smelter during the past few weeks that false notion has been dissipated and the country will now forge ahead at a pace little dreamed of in the years gone by.

Beaver's Copper Belt.

The Beaver copper belt is pre-eminently a field for the operation of great big enterprises. The ledges are uniformly large, and, as compared with other copper-producing regions, the values run high. This is most clearly shown in the development of the Newhouse's Cactus, where the first ledge opened has proven to be over 100 feet wide, with the ore averaging easily 5 per cent copper to a depth of 600 feet and along the strike for even a greater distance, or as far as explorations have gone. During the year, in running out from the bottom of the shaft to meet the adit being driven from the mouth of Copper gulch, a second ledge, even larger than the first one, has been encountered, and as far as possible explored, with the result that the ore bodies have been found just as strong and rich as those uncovered in vein No. 1. The method of development in this property has been one that all other companies in the district have followed after with profit to themselves. Every dollar expended has been made to count in either the opening up of the ore bodies or in providing the means of their rapid and economical extraction when the real work of mining begins. The work has been planned and carried out by M. M. Johnson with the same attention to systematic business that has characterized his development of the Boston Consolidated company's magnificent property at Bingham. While development of the mine has been in progress Mr. Newhouse's business manager and chief of metallurgical staff, A. F. Bettles, has worked out the plans for concentrating the ores and looked after the building of the water works system, which was secured in the purchase of the famous Wah Wah springs, about ten miles across the valley from the mines. Water is now being delivered through a fourteen-inch

pipe line, and just as soon as material can be delivered the erection of a 1,000-ton mill will commence at a point not far from the mouth of the Cactus tunnel, and just above the site selected for the building of the town of Newhouse. When this great undertaking has been fully rounded out, the investor will have an illustrated lesson of how to spend money and get returns from copper propositions, the like of which cannot be seen every day.

Other Big Properties.
Adjoining the Cactus property are those of the Blackbird, Imperial and Comet. In each of them fine bodies of ore exposed—showings at which as good as were those in the Cactus when Mr. Newhouse paid \$210,000 for the ground and went to work—and with the same ability, nerve, judgment and money behind them that the Cactus has had, there is no reason to doubt that they will become splendid mines. The Blackbird property is doing some very large sums of money during the coming year operations will be commenced on an extensive scale.

Guggenheim's Reported Purchases.
It has been reported here that a sale of the Imperial and Comet properties to the Guggenheim Exploration company—the mining end of the American Smelting & Refining company—was completed but in the hands of Mr. Lewis, who is at the head of both, nothing authentic on the subject could be obtained. The properties are mighty good, and the prospect has been opened that they will be brought to the front by someone during the year 1904.

As stated in the beginning of this resume, the Majestic company has done its share during the year in proving up the value not only of its properties, but those of the entire section, by demonstrating that the ores work splendidly in copper blast furnaces. Very large sums of money have been spent by the company in equipment, not only of the smelter, but the mines as well, and a small army of men has found employment during the year. It is understood to be the policy of the men who recently secured control of the company's affairs to devote the next year or two to the further opening of the mines and then go into the production business to stay. The Majestic craft has had a troublesome voyage during the past twelve months, and it is to be hoped that fair sailing will be its portion during the year to come.

Work on the Royal.

During the year A. B. Lewis launched his Royal Gold & Copper Mining company, capitalized at \$10,000,000 and covering some eighteen or twenty groups of mining claims with an acreage of 100,000 acres in the state of Nevada. Owing to the very unsettled condition of the country's investment centers, however, he has not pushed the proposition to the point of development. The work, it is understood, is to be taken up again with the opening of the new year, and, barring unforeseen difficulties, much will be accomplished during 1904.

ON THE FACE OF A DRIFT.

complicated during 1904. One of the chief properties held by the new company is the Montreal group, adjoining the majestic company's Old Hickory. A big shaft is to be sunk upon it during the coming year, and, judging from the developments of the past, it should make one of the great copper mines of Beaver county. A number of the other properties acquired have made fine records as producers of rich ores near the surface, and when all have been developed at depth, great things are predicted for them.

The Blue Acre company, with valuable ground adjoining the O. K., has been quietly but systematically prospecting and developing its territory during the year, besides making many permanent surface improvements. Results to date are all more than the management has expected, and the prospects for obtaining most substantial results during the year to come could hardly be better.

Good Showing by All.

The Beaver Consolidated, Skylark, O. K. Extension, Copper Ranch, Copper Mountain and numerous other properties along the great copper belt have made showings during the year that are anything but discouraging, and matters are being so shaped by a great many companies that the campaigns of the future will fairly outstrip all previous undertakings.

Milford, which is the distributing center for the entire mining region of Beaver county, has grown from a little ramshackle town of a few houses and a railroad depot to a thriving city, which was recently incorporated and placed in the hands of progressive citizens to govern. As a result permanent improvements are being made and every hand faith in the future is being exhibited by business men.

REMARKABLE PLANT.

Gives Off Combustible Gas, and Is Said to Be Moses' "Burning Bush."

A remarkable plant is now at Kew gardens, London's celebrated horticultural grounds, on the Thames. The plant has just been brought from the Arabian desert, and numerous scientists declare it to be identical with the "burning bush" which Moses saw burst into flame at his approach and blaze for some time without being consumed. The plant at Kew, which grows to the height of five or six feet, possesses the remarkable property of exhaling an inflammable gas from its flowers, which, on being approached by a light, takes fire and burns brightly for a few moments, the plant in the meanwhile remaining unharmed, owing to its sap.

His Christmas Schedule.

(Atlanta Constitution.)
"You know what dey gwine give you for Christmas?"
"No, I ain't studied 'bout it yet!"
"Beaver hat!"
"My, my!"
"Long-tail coat!"
"Till de truth!"
"Sleazy collar!"
"Lard bless us!"
"Biled shirt, kid gloves, en a gold-head walking stick!"
"De Lawd save us!" exclaimed the prospective heir to all the above gifts. "Has I got ter go ter preachin' de gospel in my ole age?"

A Good Reason.

(New York Times.)
An Irishman ordered corned beef and spinach in a restaurant on Christmas day. Having eaten all of the corned beef first and the spinach afterward, another diner, who evidently knew him, asked for an explanation.
"It's to keep the green about the red," replied the Irishman.

TWO BIG BODIES DEVELOPED BY SAMUEL NEWHOUSE

Two of the largest mines, if not the two largest in the State of Utah, are the Boston-Consolidated property at Bingham and the Cactus property, in Beaver county, out from Frisco. The former has been completely developed and equipped for shipment. The latter, the computation of which, in figures, becomes tiresome. The latter has been fully explored to prove it a veritable bonanza and arrangements on a scale hitherto unknown in the development of this region have been provided for, so that within the next six or eight months it will have become a producer also. The grading, construction, financing and development of these great properties has been accomplished by Samuel Newhouse, managing director of the Boston-Consolidated company, and president of the Newhouse Mines and Smelters, a corporation owning the Cactus property and in both of which Mr. Newhouse is principal owner and the ruling spirit.

Many Problems to Solve.
The Cactus is a large property, the citation of which has been hitherto prevented by many difficulties, all of which required a great outlay of capital to overcome them. While the ore bodies are phenomenally large, the values are low grade. Water could be obtained in limited quantities. The wagon road to Frisco is over ten miles, so that to haul ore to the point of bringing fuel from it to operate a smelter would entail an expense which was practically prohibitive. To concentrate the stuff would also require fuel for power making purposes equal to the water supply, with uncertainty as to the water supply being commensurate to an undertaking of that magnitude. This property has raised through the hands of several owners, including a strong combination of French capitalists, all of whom have been unable to solve the problem to the financial profit, either by smelting at the mine or by shipping ore. With development work done sufficient to establish the fact that the Cactus was one of the richest propositions in the entire west, Mr. Newhouse obtained title absolute to the ground and cleared the deck for action on a large scale and in an aggressive manner, seemingly almost regardless of the expense that was sure to follow.

Pipe Water Eight Miles.
To provide the mine and the people necessary to work it, who will comprise a town of themselves, Mr. Newhouse looked to the nearest water supply, which was the Wah-Wah springs, situated on the opposite side of the mountain air it appears as a garden spot, only an hour's walk away, but traveling that direction the distance becomes wearisome and the garden spot expands into a ranch, provided with orchards and fields of grain. These signs of life and cultivation, practically of their kind in sight, are nourished by the product of the springs, which is from 1,500 to 1,600 gallons of water per minute. The ranch was a stopping place for stockmen and travelers and was, therefore, a valuable station. To take away the water meant a destruction of the ranch and in order to obtain the one, it was necessary to purchase both the water and the ground, which was done at a cost of \$250,000. To secure a meeting of this water and these ores from the Cactus mine a pipe line for the water and a tunnel through the mountain to the edge of the valley were

Samuel Newhouse. Moving Ore from Boston Consolidated before Completion of Copper Belt Railroad to the Mine.

westerly in a general course nearly parallel with the tunnel. Within the veins the ore is found in streaks and the extent of these streaks can only be realized by personally examining them.

Tremendous Ore Bodies.

A minute description of the work, and the result of the computation of their tonnage would be a tax beyond endurance to the credulity of the ordinary reader. The first ore body, however, has been explored to a depth of 600 feet, and cross-cut have been run on every 100-foot level. At the first level from the top the ore body is 100 feet wide, and on the lower level it has gradually increased to a width of 115 feet. Along and with this streak dritts have been run 350 feet, all this work being in ore as uniform in appearance as the bricks in a wall. Another ore body, and the bodies are all parallel, has been followed 200 feet on the first level, along the vein, with a width of 50 feet. A third ore body is 80 feet in width at the third level, and has been followed 100 feet with no end to the ore. Still another and seemingly the largest of them all has been reached through the cross-cut on the 600-foot level, showing a width of 125 feet. This has been followed 200 feet on length, with ore at both ends. The three first bodies described are in the same vein, while the fourth is in a parallel vein.

The Boston-Consolidated has an area approaching that of the Cactus, and is measured by 350 acres of ground. It is located about the head of the canyon, and is joined on all sides by the most likely properties and heavy producers in Bingham camp. Included in this list is the Highland Boy, the Yampou, the Commercial owned by the States smelter, with the result that the management of the mine is inclined to increase rather than to curtail former estimates of the values. The ore is copper sulfidated, with an excess of iron over silica, for which a premium is offered at the smelters. Occasional streaks of copper are found that carry better than 50 per cent of the red metal and correspondingly high values in gold and silver.

Contract For Ore Treatment.

The equipment includes a power house, with ample machinery and electrical appliances for operating the mine to almost any desired capacity and extent of production. There are now in the chutes over 1,000 tons of ore broken down, and the production of 700 tons a day can be commenced on twenty-four hours' notice, and continued indefinitely without taxing the present development. A contract was recently made with the Bingham-Consolidated smelter for the delivery of 200 tons daily for a period of two years.

In the annual report of Mr. Newhouse, made a year ago, it was stated that 1,113,716 tons of ore were blocked out. This estimate was arrived at by computing ten cubic feet to the ton. By shipping experience it has been learned that a ton of ore weighs only nine cubic feet. This difference increases the former estimate 220,000 tons. The work of the last year has added to these totals \$55,000 tons, so that the total tonnage now aggregates 1,658,716 tons. This ore, it is stated, should average 4 per cent, or better.

The last report, issued in November with the contract with the Bingham smelter, says: "The ore is to contain not less than 3 per cent copper, shipments to commence on the date of the completion of the railway to the mine. On this grade of ore, the net profit accrues to the company of from \$3 to \$5 per ton. This profit should be increased if our ore maintains a high excess of iron over silica, for which a premium is offered at the smelters and will do so from time to time as our interests demand."

Output Easily Increased.

"By these contracts we have obviated the necessity of raising capital to construct our own smelting plant and the building and maintenance of tramways and are enabled to secure an immediate revenue from our product at a minimum cost of transportation and treatment. Should it be necessary or desirable to erect our own plant for the receipt of our ore, or to contract with other smelters, the contracts already made will not interfere, because we are prepared to furnish 500 tons a day in addition to the amount required by our contract with the Bingham Copper & Gold Mining company."

"We have always regarded our ore as neutral in character, containing about an equal amount of silica and iron, but on the ore already shipped we have discovered an excess of about 17 per cent iron. The smelter pays us 10 cents per unit on the excess of iron over silica. On the ore shipped and settled for we have received on the smelter \$1.70 per ton on this account. In our contract with the Bingham company, that company has allowed a profit of \$1 per ton, but we have figured on one ounce of silver per ton, but returns from ore already shipped show over two ounces. Our gold values have also increased, as shown by the smelter reports."

"In preparing our stopes for shipment from No. 1 cross-cut of the Peabody tunnel, the ore which I have heretofore reported as 2 per cent copper changed to 3 per cent. And the entire stopes is been and is still being developed in the mines."

No less energetic has been the operation of the Consolidated Alta company under the management of Henry M. Crowther. This company did not get down to work until the present year. During the summer, however, it mines have been equipped with a vast amount of development work has been performed and with astonishing results. At the present time about fifty tons of ore per day is being crushed and preparations are making to largely increase the output next season. This company is also arranging for the installation of a mill and boiler plant of iron of a size and like its neighbor the Columbus, it will make things hum during 1904.

Others Have Fine Showing.
The Alta-Quincy company is another strong combination that is making a fine showing in its property, and it, too, will be heard from in no uncertain manner during the twelve months to come.

Review of Alta.

When the camp went to pieces mining was not conducted in the scientific, systematic manner that it is today. The geology of the camp was but little understood, and, on account of lack of economical appliances and machinery, mining was expensive and smelting more so. No one then thought of bothering with \$30 or \$40 rock, and concentrating methods were never or a small degree, notably the lily of the valley and the meadow sweet, which grow so profusely in English meadows. The blossoms of both these plants exhale the fumes of deadly prussic acid by night, and all flowers throw off considerable quantities of carbonic acid gas in the darkness, this being why it is unhealthy to keep flowers in a bed room."

Then the Kennebec company,

which owns the old Reed and Benson and the Maxfield properties, has been making a fine showing in its property, and it, too, will be heard from in no uncertain manner during the twelve months to come.

Explains the Situation.

(New York Times.)
Professor E. B. Shallow, who is assistant superintendent of schools in Brooklyn, tells this story of a peculiar excuse for absenteeism:
"One of the little boys in the kindergarten, when asked to show up on the next morning," he said, "but another youngster, who lived in the same apartment house, Newmarket, explained to me that his grandpa is dead and they are going to have the party today."

ACTIVITY IS PHEOMENAL IN THE COLUMBIAN WOODS

More Men Now at Work in Alta Than at Any Time Since 1876.

Camp Already a Steady Producer—Several Promising Mines Being Opened Scientifically on a Large Scale.

So much is being done and so little is said about it that it is almost out of the question to give the reader a fair idea of the headway which has been made in the Big and Little Cottonwood mining districts during the past twelve months. It can be truthfully said, however, that in addition to the building of new hoisting works, power plants, boarding houses and the making of other and varied improvements calculated to assist in making mining profitable, a prodigious amount of underground exploration and development has marked the operations of the year in each camp.

A revival of Alta began a little over two years ago, after the camp had seen little more than the work of leasers for a period of twenty years. Attention had been repeatedly drawn to the merits of the district by the public prints, and finally capital began to investigate. Since then some very strong companies have been organized to absorb old and new ground, and at the present time there are more men at work in the camp than there have been since 1876, when the then operating companies had exhausted the known deposits of ore near the surface and had come face to face with the water problem.

When the camp went to pieces mining was not conducted in the scientific, systematic manner that it is today. The geology of the camp was but little understood, and, on account of lack of economical appliances and machinery, mining was expensive and smelting more so. No one then thought of bothering with \$30 or \$40 rock, and concentrating methods were never or a small degree, notably the lily of the valley and the meadow sweet, which grow so profusely in English meadows. The blossoms of both these plants exhale the fumes of deadly prussic acid by night, and all flowers throw off considerable quantities of carbonic acid gas in the darkness, this being why it is unhealthy to keep flowers in a bed room."

For several months past the camp has been producing an average of 100 tons of ore per day and when spring comes the tonnage will be largely increased by the companies now shipping and those which will then be ready to join the lists. Mills will also be erected, the camp will be connected with the smelters by a narrow-gauge railroad and the great power plant of the Columbus Consolidated company will be making mining and milling comparatively inexpensive.

Two Great Properties.

The Columbus Consolidated company, under the management of its founder, Tony Jacobson, has made a wonderful record during the year. Its mines have been converted into veritable bonanzas, substantial and fireproof buildings have been erected and a power plant, with capacity enough to supply the needs not only of the company itself but many of its neighbors, is being completed a short distance down the canyon from the mines. Over \$15,000 worth of first-class ore is now going monthly to the smelters, and during the coming season a mill of generous capacity will be erected to take care of the world of fine milling ore that has

Explains the Situation.

(New York Times.)
Professor E. B. Shallow, who is assistant superintendent of schools in Brooklyn, tells this story of a peculiar excuse for absenteeism:
"One of the little boys in the kindergarten, when asked to show up on the next morning," he said, "but another youngster, who lived in the same apartment house, Newmarket, explained to me that his grandpa is dead and they are going to have the party today."

From the foregoing statements it will be apparent that our company has entered on an era of prosperity, which I confidently assert will continue for years to come. We have explored a small portion of our territory. To the east of our present workings our vein can be traced a distance of 1,400 feet in ground wholly unexplored. To the north and south we have a large acreage of virgin ground which we have reason to believe contains other veins and mineral deposits. When we consider, speaking of the necessary work already exposed, the depth as yet undetermined, we have the right to assume that our company is the owner of one of the bonanza mines of America."

Why Mr. Newhouse Succeeds.

Mr. Newhouse, to do his story plain justice, is endowed with a strong combination of abilities necessary for success in cover, manage and operate mines. In other words, he has a variety and strength of capabilities that embody the enthusiasm and confidence of the promoter, the power to read and determine upon the value of ground, assisted by the best talent, as he is, that can be obtained in the mining world, and last, but not least, the judgment to expend the money so obtained as to get results without dead work or disappointment to investors. When asked as to the secret of his success, some weeks ago, he was inclined to deny that he was an enthusiast, but when pressed for the solution of his numerous triumphs he said: "Every permanent successful business enterprise is based upon the pillar of truth. I have insisted in dealing with others and with having others deal with me on this basis, and especially in this insistence enforced with those in my employ. Deception is not tolerated. In examining and reporting upon properties, I aim to use my best judgment and report all the circumstances against them as well as those in their favor, and I have never made a report or an assertion that was not verified by the facts. I have pressed for the solution of his numerous triumphs he said: "Every permanent successful business enterprise is based upon the pillar of truth. I have insisted in dealing with others and with having others deal with me on this basis, and especially in this insistence enforced with those in my employ. Deception is not tolerated. In examining and reporting upon properties, I aim to use my best judgment and report all the circumstances against them as well as those in their favor, and I have never made a report or an assertion that was not verified by the facts.
