

No, Philburt, I am not a-arguing with you.  
I'm just a-telling you

—when you want a *real* smoke, get behind a pipeful of Tuxedo and watch all the big and little Worries that have been a-besieging you, evacuate their trenches and make a rushin' advance to the rear. Those fragrant whiffs of "Tux" make them feel too joyful—no self-respecting Worry can stand for that.

FRITZ KREISLER  
World-famous Violinist

"I have certainly found in Tuxedo the one and only tobacco that measures up to all my requirements, rich in fragrance, always cool smoking and so mild that I can smoke pipeful after pipeful at a sitting."

*Fritz Kreisler*

# Tuxedo

The Perfect Tobacco for Pipe and Cigarette

The combination of the best smoking-tobacco leaf in the world and the best method ever discovered for refining and mellowing tobacco puts Tuxedo in a class by itself.

Kentucky's ripest, mildest Burley leaf, when treated by the original "Tuxedo Process" loses every trace of bite—develops a wonderfully pleasing fragrance and flavor that are not found in any other tobacco.

No other manufacturer knows the "Tuxedo Process"; that's why no imitator ever equals Tuxedo!

THE AMERICAN TOBACCO COMPANY

### Good Cream Pays Best.

The American farmer who sell cream should insist that the creamery grade his cream. This will tend to cull out the poor quality of cream and make possible a better grade of butter. Give the creamery a good grade cream and they can make a good grade of butter. Good butter sells for a high price, therefore top prices can be paid for the cream. Better cream prices stimulate the farmer in obtaining better dairy cattle and increase the desire for a more careful study of economical milk production.

The close grading of cream has become absolutely necessary. Within the last few years creamery butter of the United States has been meeting with greater competition from foreign butter. Butter from Siberia, Australia, Denmark and South America has come to our shores by the ship-load and sold in our large markets alongside American made butter. It has poured into the United States on both the eastern and western coasts.

Imported butter does not reach our markets in as fresh condition as our own butter, consequently the majority of it sells as second grade. In many cases it leaves the point of production as a first class article, but is so long in transit that it deteriorates and arrives as second-class butter. Unfortunately the ma-

majority of American made butter is also second grade. This is not because it cannot reach the market at once, but because it is made from a poor quality cream. The American farmer is not producing as good quality of cream as his foreign brother.

First grade butter is still in big demand in this country and the producers of good butter are realizing a nice margin in price over the producers of second grade butter. Because of foreign competition with our second grade butter the difference in price between first grade and second grade is wide. Foreign competition has not materially increased the supply of first grades, while the supply of seconds has been increased tremendously.

Because of our poor markets for second grade butter the farmers in every community should compel their creamery to grade the cream, and should do all in their power to see that every farmer produces only first grade cream. Then and only then will that creamery be able to pay top prices for cream.

Miss Martha Legg went to Marshall Sunday morning for a visit.

Miss Leona Goodwin and brother, William Goodwin, went to Kansas City Saturday for a visit.

## CASTORIA

For Infants and Children  
In Use For Over 30 Years

Annie Gottenstroetter and husband to C. B. Engle W. D. \$1000 lot 7 block F. Fred Leise's addition Corder.

Ed. Thompson went to Napoleon Saturday to spend the day on business.

**Clover Bloat.**  
Columbia, Mo.—Dr. D. F. Luckey, State Veterinarian, has issued a statement from the office of the Missouri Board of Agriculture in which he says the recent losses of cattle from bloating, while on Clover pasture, have been quite extensive. The weather has been favorable for rank growth of all kinds of clover. The white variety seems to be responsible for the most of the trouble.

The danger is particularly great on damp, cool days when the clovers are fresh and palatable. Cattle are very apt to over-eat. The rumen (or paunch) becomes over-loaded and the fermenting mass causes a rapid generation of gas.

The symptoms usually come on in a very short time. A cow may be in a dangerous condition within a half hour after eating heartily of the white or other clovers. Frequently, the bloating is so intense as to produce death before any treatment can be given. The rumen becomes so distended with gas as to press forward on the lungs and make it impossible for the beast to inhale air, literally smothering to death.

The principal thing to do by way of prevention is to keep cattle off of rank clover pastures, especially early in the morning, after showers, or during damp, cool days. Such pastures must be used with care at any time. It has been claimed that feeding dry wheat straw, or cured hay of any kind, will tend to prevent bloating when cattle are turned on clover pastures. There is no question but what this will help some but it cannot be counted on as a sure preventative of bloating. Some dry feed should certainly be given when cattle are pastures upon a rank growth of clover. In addition to this, a liberal quantity of freshly burned charcoal should be kept before the cattle. Burn a lot of charcoal every two or three days, powder it and add a little salt and leave it where cattle may lick it at will. There is practically no danger of over-feeding on charcoal, and this will help a lot in preventing bloat. Bear in mind that in some cases bloating will occur even when cattle are kept off the clover until noon, and there is no absolute means of prevention of bloat when cattle are permitted to graze on clover.

The curative treatment depends upon the condition of the animal when found. In many cases, the animal is already dead. In other cases it is in a condition to die in a few minutes, and treatment must be administered promptly. In acute cases, there is no time for giving medicines by the mouth. The only successful treatment is to puncture the rumen and let the gas out. Unless this is done promptly, death may result. The trochar is the proper thing to use. The trochar should be clean and disinfected, as should the hair and skin where it is to be inserted. Use the necessary force and drive the trochar into the rumen on the left side and at a place several inches forward and downward from the point of the hip where you find a drum-like condition. In many cases, the trochar will not be available and there will be no time for cleaning and disinfection. If the animal's life is to be saved, something must be done right away. In such an emergency do not hesitate to use a pocket knife, or even a butcher knife. Let the gas out or the cow will die. If these crude instruments are to be used, the opening should be quite large. Use the big blade of the pocket knife, and then cut the hole just a little larger so that the gas may escape freely. This operation is not particularly dangerous and should not be delayed when the life of the cow is in danger.

Ray Smith spend Sunday in Kansas City.
