The climate of the central northern states is well suited to the quince, and almost any of the soils that are rich enough to grow good crops of corn, potatoes or garden stuff would be in right condition. It may be heavy clay or of a sandy nature, for this tree will flourish in either kind. Plenty of rich and well rotted stable manure will help the soil. The trees may be planted in the spring or fall, the latter being preferred, because the trees get well settled in the ground and start early to grow the next spring. The proper distance apart to set the trees is about twenty feet. They should begin to bear in about five years from the time of planting, but may do so a little earlier if well treated. The Orange and Meech are two of the best early kinds, and Champion and Van Deman are good late ones.

### Rhubarb From Seed.

The usual practice is to propagate rhubarb from pieces of root, but it is practical and easy to grow the plants from seed. By planting seed in a very rich, well prepared soil where the plants are to remain permanently stalks may be had ready for cutting about as soon as when root planting is followed.

### MULCHING.

Nitrate of soda can be used with benefit on all crops. It is immediately available and should therefore be only employed in connection with plants in an active stage of growth. There is far too little mulching done. Small fruit trees and garden crops are given a most favorable opportunity for attaining the highest perfection and development when their roots are covered with a thick mat of leaves, hay or other suitable material. A good mulch keeps down weeds and renders the soil loose, moist and porous at all times, and that, too, with little labor of cultivation.

### HOW TO GROW ALFALFA.

Information issued by the New York State College of Agriculture.

Alfalfa will grow on almost any type of productive soil if it is well drained and if it is not acid. Lime must be applied to at least three-fourths of the cultivated soils of New York if alfalfa is to be grown successfully. Such are the statements made in a publication entitled "Alfalfa in New York," recently issued by the New York State College of Agriculture.

In many cases soil must be inoculated with nitrogen gathering bacteria for alfalfa, and this may be done in either of two ways, according to the college. Soil may be procured from an alfalfa field or a sweet clover patch and applied at the rate of from 200 to 300 pounds an acre to the new field just before sowing. This soil should not be allowed to dry before it is applied. The other method of inoculation is by means of cultures, which may be obtained at cost either from the United States department of agriculture or from the State College of Agriculture at Cornell.

Alfalfa should be cut when the new growth from the base of the plant is from one to three inches high, regardless of whether the plant is in bloom or not, so the college authorities state. This new growth starts as the plants reach maturity.

Care should be taken not to use alfalfa seed infested with dodder. Dodder seeds may be removed, it is said, by screening the seed in small quantities through a 20 by 20 mesh sieve made of No. 34 wire. Dodder infested spots in an alfalfa field should be closely mowed, the stubble sprinkled with kerosene, then covered with dry hay and burned.

### Shelter For Brood Sows.

The brood sow should have a comfortable shelter in winter. Good shelter, preferably in a cot well supplied with straw, will contribute to her well being, and in that lies strength for her offspring. The shelter should be placed a considerable distance from her feeding place in order that she may be compelled to take exercise. Her feed should consist of bulky foods, such as milk, roots and clover hay and enough grain to keep her in good condition without causing her to put on fat.

### Dirt in the Milk.

Much of the dirt found in milk gets there during the milking. Any pall that will keep out cow hairs, dandruff, dust, pieces of dried manure, chaff and hay is a good pall. The difference be-

tween open and closed pails in the matter of cleanliness is considerable. The less open space the less opportunity for dirt and bacteria to get into the pail while the cow is being milked. On most dairy farms the old style pall with the flaring top has been replaced by something that will aid in keeping out the dirt.

### SOME BEE WISDOM.

"Any old thing" does not make a suitable hive in which to keep bees.

Queens are mated but once in their lives and then out in the open air.

Beating the dishpan or ringing the dinner bell never settled a swarm; they just naturally cluster after leaving the hive.

Bees have no more to do with the scattering of fruit diseases than do the other hundreds of insects that visit the flowers.

It is not a sign of ability to make a practice of trying to handle bees without smoker or veil; it's just foolhardiness.

It does not pay to keep more colonies than can be properly cared for. Better sell off some than buy more and not care for them.

## SPORTS

We have recently added to our various and well stocked lines a complete assortment of fishing tackle, to lure the finny tribe, at a right price. If in need of anything in the way of poles, tackle, reels, hooks or lines drop in and talk first.

In our last ad, we advised the ranchers and farmers who have spring seeding to do to buy their formaldehyde and insecticides at once, on account of this class of merchandise on the up grade in price. Following prices will be good only until March 25, 1916.

Formaldehyde, pints 40c  
Formaldehyde, quarts 75c  
Paris Green 1 pound 50c  
Paris Green 1/2 pound 30c  
Paris Green 1/4 pound 20c  
Strychnine ounce \$1.25  
Strychnine dram 25c  
Phosphorous 1/2 pound 50c  
Lead Arsenate Powdered 1 pound 25c  
Lead Arsenate Powdered 1/2 pound 45c

A special price of \$2.25 per 25 pound pail of Dr. Hess & Clark Stock Tonic. Why pay the peddlers \$3.50.
