DESTROYING INSECTS.

Missouri College of Agriculture Issues Information For Getting Rid of Pests. [T. J. Talbert, Missouri station.]

Corn root worms yield best to crop rotation, systematic clean culture and fall plowing.

Garden webworms eat alfalfa, live and spin webs over the plant. If your field is badly infested cut the alfalfa and disk the ground.

Wireworms injure corn and potatoes most, but feed freely on wheat and oats. They thrive best in sod ground and may be controlled by crop rotation, fall plowing and good cultivation. So may the grubworms.

Grasshoppers damage field and garden crops and fruit and shade trees. Poison bran mash sowed early in the morning kills them, and their eggs may be destroyed by cultivating pastures, meadows and waste lands late in the fall.

Corn root lice suck the juices from the roots of corn, grasses and weeds. They depend on protection of small brown ants for protection and transportation and may be controlled by crop rotation, fall plowing and early spring cultivation to destroy weeds and grasses.

The army worm, which eats the leaves of field and garden crops, may be trapped in dusty ditches or killed with poison bran mash sowed broadcast late in the evening. Badly infested meadows should be cut at once to save as much of the hay as possible.

Hessian fly grubs feed between the leaf sheath and the stalk at the crown and lower joints of the plant. Destroy the "haxseeds" which produce next year's crop by disking and plowing stubble as soon after harvesting as possible. Keep down all volunteer wheat, sow late in the fall and get your neighbors to do the same.

The chinch bugs suck the juices of corn, wheat, sorghums and other plants of the grass family. They may be trapped in dusty ditches if they go from wheat to corn, or in rainy weather an oil or tar barrier may be necessary. If they get to the corn spray it with soapsuds, emulsion or tobacco solutions. The clump forming grasses by roadsides and in waste land may be burned in late fall and early winter to kill chinch bugs which collect there for the winter.

The poison bran mash recommended by the Missouri College of Agriculture for the control of many insect pests is made of half a pound of powdered lead arsenate or half a pound of paris green mixed with ten pounds of wheat bran. Add two gallons of water into which the pulp of two oranges or two lemons has been mixed, together with a quart of molasses or sirup.

Corn Crops Pay.

A number of experiments made in different states show that a really good corn crop pays from \$50 to \$100 an acre instead of \$15 to \$20. In addition to this, expert corn growers often add to their profits by selling a high quality of seed to their neighbors and city dealers. It is evident the crop can be made worth much more than ordinary by skill and care.

Vat For Small Flock.

The illustration shows a good type of small dipping vat of about the right size for the average small farm flock. Its construction is simple and fairly cheap. The place for the vat is dug out in the ground and lined with

either bricks or cement. The runways should be floored with pine boards, and the fencing may be of any suitable material. Where it is not desirable or possible to buy some one of the many good metal portable dipping vats for small flock use, a permanent tank like this will meet all needs.—Farm Progress.

Sheep For Weeds.

Sheep are the sworn enemies of weeds. They clear up waste vegetation and turn it into mutton. By eating down and trampling the weeds on the fields and along the fences they destroy many insects which harbor in the weeds. If the sheep merely pay for the extra grain given them it is profitable to keep them as scavengers and insecticides.

GET SOME BEES!

Have you bees? Why waste a honey crop? Why let your neighbors' bees get your crop?

Buy bees by the pound with a good Italian queen.

Get a few swarms of your own this spring or summer. Catch runaway swarms and hive them in good hives.

Buy neglected stands of bees and take care of them and give them a chance. The bee is a faithful and deserving creature.

Furnish a neighbor beekeeper with a few good hives, with frames and comb foundation starters and pay him for living a few swarms in them for you.

Buy good strong colonies of bees in hives with straight combs. These should be secured from some one known to be reliable and experienced in beekeeping.

Buy a few nuclei from a reliable bee supply man. A nucleus is a part of a colony of bees secured by dividing up a strong colony into two, three or four parts, putting each part in a separate hive to build up into a full colony.—L. Haseman, Missouri Station.

FEDERAL MEAT INSPECTION.

Protects Public Health by Preventing Sale of Diseased Flesh. [Prepared by United States department of agriculture.]

The federal inspection of meats and meat products serves three important purposes. First, it protects the health of the people by preventing the sale in interstate commerce of diseased meats; second, it is essential to the preservation of our foreign trade in meat and meat products, which are still an important part of our total exports, and, third, it is the most effective agency

INSPECTOR EXAMINING VISCERA OF CARCASSES FOR EVIDENCE OF DISEASE.

for the gathering of information, essential to the eradication of destructive animal diseases.

Federal meat inspection is conducted under the provisions of the act of congress of June 30, 1906, which is commonly known as the meat inspection act. This act requires all meat and meat products which are to be used in interstate or foreign commerce to be inspected by federal inspectors. There is an ante-mortem examination of all animals and a post mortem examination of the carcasses and of food products, such as canned and salted meat. Articles which are found unwholesome within the meaning of the law are condemned and destroyed for food purposes in the presence of an inspector.

The cost of the service to the people of the United States was less than 6 cents for each one of the animals slaughtered. In return for this outlay, as has already been said, not only was the health of the people protected and exports which amounted to a total of 1,391,000,000 pounds of meat made possible, but valuable information in regard to the existence of diseases as

INSPECTOR (ON LEFT) EXAMINING HEADS FOR EVIDENCE OF DISEASE.

Important from an economic standpoint as tuberculosis and other parasitic affections were obtained. The eradication of these diseases will lessen enormously the losses which farmers now have to bear in raising live stock for human food.

The eradication of disease in those sections in which it exists is dependent upon the co-operation of the states with the federal government, but it is not too much to hope that the time is not distant when an enlightened public knowledge and appreciation of the importance of such a program of disease eradication will lead the states to grant their officials the power and support necessary to its success. When that time arrives the federal meat inspection service will be found ready to provide in great volume the essential data and in other ways to contribute to the success of the governmental undertaking."
