"DUST EXPLOSIONS" SUMS UP 7 YEARS OF INVESTIGATION.

Dust Explosions, a book containing the results of 7 years of investigation by the United States Department of Agriculture, is soon to be issued by the National Fire Protection Association, Boston, Mass., in the interest of reducing fire and explosion losses. The book was prepared by David J. Pricer and Harold H. Brown of the Bureau of Chemistry of the department, and is expected to be a welcome addition to the meager literature on a subject that has been found of great economic importance to divers industries. It is of interest particularly to manufacturers in dust-producing industries, operators of grain thrashing outfits, coal mine operators, owners of cotton gins, fire and accident insurance companies, inspection departments, engineers, architects, colleges, and libraries.

One of the numerous tables shows that in this country there are now about 21,000 manufacturing plants in which combustible dust is an unavoidable by-product. These factories, always under the menace of loss through dust explosions, annually turn out products to the value of nearly 7 billion dollars. That there is widespread danger has been proved by the occurrence of disastrous explosions of dusts of aluminum, coal, cork

cottonseed, flour, grain, leather, malt, phonograph records, rice, rubber, sawdust, spices, starch, sugar, and sulphur. The authors have investigated every notable dust explosion in the United States and Canada many of which are discussed in the new publication.

Chapters are devoted to nature and theory of dust explosions, industries producing dust and their extent, elimination of sources of ignition, prevention of explosions by control of explosive mixtures, phenomena of explosions, dust collection and removal, static electricity, explosions in grain thrashing machines, plant construction, cotton gin fires, coal dust explosions, and review of explosions.

INSPECT IRRIGATION FARMS.

Wednesday, July 12 has been selected by E. C. Johnson, Director of the Experiment Station and R. P. Bean, Superintendent of the Irrigation Branch Experiment Station at Prosser, Washington, as the date for the Demonstration Day at the irrigation station. Everyone interested in irrigation farming is invited to inspect the station at Prosser and the work under way at that time.

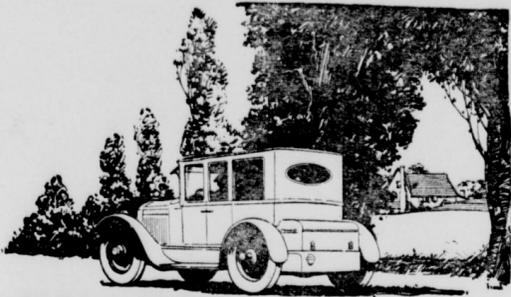

It is just three years since this 200 acre Experiment Station was started on raw sage brush land and many interesting experiments in the production of crops under irrigation, varieties to be used, cultural methods and the use of water are now under way. Every acre is in crop this year. Varietal work with alfalfa, corn, cereals and grasses is being conducted. Studies in the establishment of pastures, pasture grasses and pasture management under irrigation are under way. Seed potato production and the diseases of potatoes are being studied. An experimental orchard has been planted this spring. Various water measuring devices have been installed and experiments comparing the border method or irrigation with the furrow method used mostly in irrigated sections in Washington have been commenced. All of this work will be available for inspection by the visitors on July 12.

THE proper nourishment takes us along the journey from here to there. Whatever your work-a-day duties, you should be properly fed. Our one ambition is to supply you with the proper meats and every one in this town knows how well we are succeeding.

BIG POWER for BIG AUTOMOBILES

You selected your car carefully for quality. Select your motor fuel the same way. It's unfair to feed a good car an inferior gasoline.

"Red Crown" answers completely the automotive engineer's demand for a motor fuel that will vaporize rapidly and uniformly in the carburetor and explode cleanly in the cylinders. All the heat units it contains are converted into power at the drive wheels.

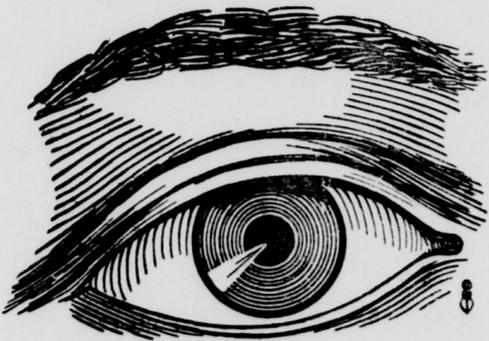

"Red Crown" is uniform in quality—every gallon is the same, wherever and whenever you buy it.

Fill at the Red Crown sign—at Service Stations, at garages, or other dealers.
