General admission to grand stand on afternoon of football day	.50
General admission to grand stand on afternoon of football day, including reserved seat	1.00
Admission to infield on football and auto days	.50
General admission to paddock	.25

OATS ON THE SMALL LOUISIANA FARM

Should Be Used as Feed Crop—Less Expensive and Surer Crop Than Corn—Can Be Followed by Catch Crop—Plant Oats in October—Oats and Vetch Make a Good Combination.

Oats on the small farm should be grown strictly as a feed crop, and as such will be found a cheaper feed, on the whole, than corn. The production of feed for the work stock, on the average, requires from one-third to one-half of the energies of the farm, and therefore the growing of this feed as cheaply as possible becomes a question of great importance.

Since the corn generally gives out in the spring or early summer, farmers frequently make it a practice to plant more or less early-maturing corn to meet their requirements at this season. Quick maturing varieties of corn are usually not very productive, the corn is of poor quality, and it requires considerable labor of men and teams in the cultivation. It is doubtful if this practice is good business. Oats will meet this need of early feed much better than will the corn crop. The land can be prepared for the oat crop and the planting done in the fall, and no further work is required till the oats are ready to harvest, usually in May, four to six weeks ahead of the early corn. The expense of growing the oat crop is much less; it is a surer crop when planted at the right time in the fall; production of feed is fully as good per acre as with corn, and an additional advantage is that the land is available for crops of lespedeza, cow peas, soy beans, peanuts or other crops during the summer.

That the farmer has no binder or that threshing outfits are not accessible should not be considered as a serious objection to the oat crop. Areas of oats not greater than 15 or 20 acres can be harvested more economically with the old-fashioned cradle, when the investment, up-keep and operating expenses of a binder are considered. Probably the best method for the small farmer in handling this crop would be to cut with mowing machine when grain is in the dough, cure as hay and put in barn. Oat hay makes a very satisfactory feed without any other hay or grain, and stock will do good work on it alone.

Oats and Vetch.

A very decided improvement in the crop when it is to be made into hay is to plant hairy vetch with the oats in the fall. The two plants grow together and mature at the same time. The vetch improves the feeding value of the hay; being a legume, it improves the soil, and makes the handling of the oats as hay much easier. The vetch ripens seed by the time the oats are ripe, and a small area should always be harvested for the mixed seed with which to plant the next crop.

October Best Month for Planting.

The growing of oats is well understood by most Louisiana farmers. The most common mistake made by them is their failure to get the crop planted at the right time. The month of October is the best time to plant the crop anywhere in the state, though early November planting will answer when it is impractical to plant earlier. Dry weather sometimes interferes with fall plowing, but it will rarely happen that a good stand cannot be secured in October, if the farmer will prepare his land some weeks in advance of planting time. When fall grazing is the object, the crop should be planted in September.

Soils.

A medium grade of land is most satisfactory for the oat crop; very rich land has a tendency to grow too much straw, and in seasons of excessive moisture the crop will lodge or fall down. Very poor or cut-over lands are very unsatisfactory for the crop.

Preparation of Land.

Plow the land well, two or more weeks in advance of planting time, if possible, and disk or harrow to a compact and well pulverized seed bed.

Planting.

Put in two to two and one-half bushels of seed per acre in October. The drill is most satisfactory for this work, but when one is not available sow broadcast and cover with disc harrow or plow in lightly.

Varieties.

There are only a few varieties of oats that are worthy of consideration in this state. The Louisiana Red Rust Proof or some of its derivatives is the best under average conditions, and no one will make a mistake to plant one of these varieties. The Fulgham is favored by some farmers, and it has the advantage of maturing about two weeks in advance of the Red Rust Proof varieties. It might be advisable to plant a portion of the crop in the Fulgham variety in order to lengthen the harvest season.

Fertilizers.

One of the most important points with the small farmer in growing oats is to see that the crop follows cow peas or some other legume. This system will obviate the necessity of applying nitrogenous fertilizer, and when the legume crop has been given a liberal application of phosphate, no fertilization of the oat crop will be necessary. If sandy land has not been given this phosphate legume treatment ahead of the oat crop, it will generally pay to apply 150 to 200 pounds of acid phosphate at planting time, and 100 pounds of nitrate of soda per acre in February or March is advisable when the price of nitrate is not prohibitive.

Treatment for Smut.

This disease is generally present and frequently does much damage to the oat crop. It may be prevented by treating the seed with a solution of formalin as follows:

Mix one ounce (two tablespoons) of formalin with three gallons of water. Thoroughly wet the seed with this dilute solution—pile on floor, cover with tarpaulin or sacks, and allow to stand for eight hours. Then spread and dry before planting.

W. R. PERKINS,
Live Stock Extension Service, Louisiana State University.

**HUSBAND RESCUED
DESPAIRING WIFE**

After Four Years of Discouraging Conditions, Mrs. Bullock Came Up in Despair. Husband Came to Rescue.

Patron, Ky.—In an interesting letter from this place, Mrs. Bettie Bullock writes as follows: "I suffered for four years, with womanly troubles, and during this time, I could only sit up for a little while, and could not walk anywhere at all. At times, I would have severe pains in my left side.

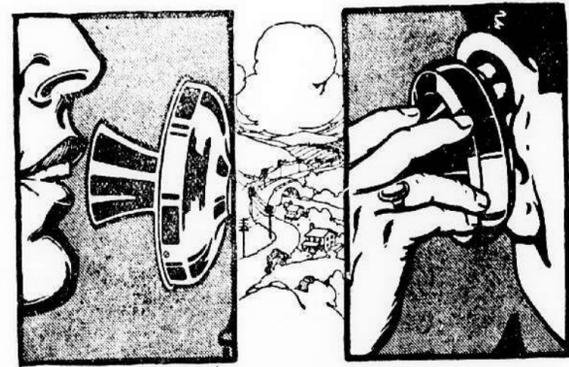

The doctor was called in, and his treatment relieved me for a while, but I was soon confined to my bed again. After that, nothing seemed to do me any good.

I had gotten so weak I could not stand, and I gave up in despair.

At last, my husband got me a bottle of Cardui, the woman's tonic, and I commenced taking it. From the very first dose, I could tell it was helping me. I can now walk two miles without tiring me, and am doing all my work."

If you are all run down from womanly troubles, don't give up in despair. Try Cardui, the woman's tonic. It has helped more than a million women, in its 50 years of continuous success, and should surely help you, too. Your druggist has sold Cardui for years. He knows what it will do. Ask him. He will recommend it. Begin taking Cardui today.
