THE HEIGHT OF WAVES. How a Sea Captain Measured the Billows in a Gale. A sea captain recently took what are probably the most careful observations as to the height of ocean waves in a gale that have ever been recorded. He made them during a voyage round Cape Horn, and to do it he went up the main rigging to get, if possible, the top of the wave coming up astern in a line of sight from the mast to the horizon at the back. The reason he selected the mainmast was this, that, as a rule, it is nearly amidship (the actual foot of the wave below the main draught equal to the eight eighths of the height necessarily is above the true height. It was a difficult operation, but the captain obtained some good observations, marking the height of the waves on the mast. On measuring the distance from these to the main draught he found them to be as follows: 61, 64, 58, and 65 feet respectively, varying in length from 650 to 800 feet.

Ruined by Floods. AGRICULTURE. May 24.—The town of Sefton, near Fez, in Morocco, has been ruined by floods. Fifty-three Jews and many Moors perished.
