

The Globe's Millions of Gold in the People's Wants.

MILLIONS OF GOLD
REVIVAL OF MINING IN THE WEST
WILL SOON DOUBLE PRODUCTION.

NEW AND UNTRIED FIELDS.
IDAHO, BRITISH COLUMBIA, COLORADO AND ALASKA TEEM WITH ACTIVITY.

NEW AND CHEAPER METHODS.
Ore Which Was Once Thrown Away Now Yields a Handsome Profit.

It is a singular thing that, while all the newspapers have been full of what the party platforms shall say upon the question of gold, and while dire threats of party bolts and even of secession have been wafted eastward from the silver states in the far West, where such matters are of paramount importance, there has been such an activity in gold mining, such a development of gold properties as this country has not seen before in a quarter of a century, says the New York Herald.

The people of New York and of the East have, indeed, been singularly obtuse to this remarkable revival of gold mining and have thus far largely failed to take advantage of the profitable field for investment here offered. The revival has taken place entirely with the aid of local capital. Very little has come from the East. While the people of England have poured millions into the South African mines the American mines have been left to shift for themselves.

It now appears probable that English capital will be the first to be invested largely in our new gold fields. The chief activity at present outside of Colorado and Utah is in the rich belt which extends from Northern Idaho and Northwestern Washington up into British Columbia, and it is in British Columbia that the largest amount of work has been done. Concerning this latter field an expert report, after having made his examination, to have said: "There is ten times as much gold in this district as in all South Africa." Inasmuch as the gold deposits of the Witwatersrand about Johannesburg are calculated at anywhere from seven hundred millions to a billion dollars, it will be seen that this is an extraordinary statement. Nevertheless it is certain that with the active development now going on in this district it will within another year become one of the chief gold producing districts in the world.

NEW BONANZA DAYS.
There is indeed a distinct prospect that the United States, including British Columbia and Alaska, will soon be pouring forth such a quantity of yellow metal as will surpass the "bonanza days" when the placer fields of California gave forth their golden flood. Last year this country produced nearly forty-seven millions of gold bullion—more than any year for nearly a generation.

Since the days of the famous Comstock lode, it has been cut down to a fourth or fifth of what it was. The introduction of the dynamite drill, of improved machinery, and of new and more perfect methods of extraction has made it possible to mine low grade ore at large profit which a few years ago would have been thrown away.

A WONDERFUL CHANGE.
This, the first of the great gold discoveries of the world, is the only gold mine, but of silver and copper mining as well. Thus, the Anacostia mine, in Montana, has produced in the past year more than \$1,000,000 worth of gold, silver and copper. It is nearly one-half all the gold of the world, and next year it is not unlikely that these sections will turn out above seventy millions. That is double the gold production of this area during any period since the Comstock days.

Nor is this all. Recent geological surveys have disclosed the probability that there are under the great lava overflows of Southeastern Idaho and Northern California gold placer beds likely to surpass in value the great placer fields from whence has come the great bulk of California's gold output.

Do you comprehend the meaning of this? Up to the present time and since the discovery of gold in '49 California has turned out approximately one and three-quarters billions of gold bullion, more than all the United States and Germany put together. It is nearly one-half all the gold of the world, and next year it is not unlikely that these sections will turn out above seventy millions. That is double the gold production of this area during any period since the Comstock days.

THE GREAT LAVA FLOW.
The great lava flow in Idaho, as it is described by the Engineering and Mining Journal, confessedly the first mining authority in America, covers a section of country about four hundred miles in length and about forty to sixty miles in width. It lies in the southeastern part of the State, on or along the course of the Snake river, and mostly on the north side of that stream. This great lava bed is the eastern end of an immense volcanic belt that extends westerly to the Pacific ocean, and the lava is of the same character as that constituting the vast lava bed in the Modoc war of 1874, in which, in the Modoc war of 1874, the Indians so long evaded the United States troops sent against them. Most of the belt along its northern side is dotted with volcanic craters, and northwest from Blackfoot station, on the Utah and Northern road, they rise, isolated, out of the plain so huge that they constitute landmarks visible to a great distance.

The Snake or Shoshone river forms the great center of the Idaho system. Both this stream and a large number of its tributaries were wonderfully rich in gold in the original discoveries having been made as far back as 1862. What was known as the "Boise Basin" was one of the richest placer regions ever found. The total area of this belt is not less than 20,000 square miles, and lying as it does in the very heart of the auriferous, or gold-bearing, region it is certain that it must cover enormous deposits of gold.

Very recently there have been discovered some exceedingly rich placers on the Snake, three miles below American Falls. The gold is coarser than is usual on that river, and it is found on both sides of the stream as far back as prospecting has been done. Rich pockets are found under all the bowlders encountered, and where the lava bed rock is exposed the seams in it are full of gold. As the river was flowing for ages and ages before the flood of lava came and filled it up, still richer deposits must be beneath in the ancient channel of the stream.

CALIFORNIA FIELDS.
The California fields extend from Plumas county on the north to Tuolumne on the south, and from the east side of Sacramento Valley to near the summit of the Sierra Nevada range, covering in all an area of about seven thousand square miles. A large part of this region was in ages past covered with trachite lava to a depth of several hundred feet, turning the streams and completely changing the face and configuration of the country. By glacial action, the huge canyons containing the channels of the present rivers were ploughed out, and the melting ice sent down torrents of water which cut them still deeper.

The glaciers doubtless did much to tear out the channels of the ancient rivers. The western portion of the California lava belt, where it passes across Modoc and the northwestern part of Siskiyou county, constitutes a very curious feature. It is exceedingly rugged and jagged in its character, and extends as far north as Mount Shasta and a line of smaller volcanic cones to the south. The prospecting of a systematic character has been done under these California beds, but in one place an artesian well was sunk which produced very rich borings and an excellent prospect.

On the other hand, the surface digging of the Idaho basins alone is calculated to have already yielded upward of \$75,000,000. All the geological conditions are present to indicate the presence of immense auriferous deposits all through the two sections named; gold has been found in scattered localities, and the flow of the ancient rivers of modern lava has been traced, and men whose opinion is of weight and who are not mere speculators believe that if these beds can be uncovered, untold quantities of golden wealth will be laid bare.

DEEP BORINGS.
The method by which an attempt will be made to locate these deposits is exactly the same as that which has been employed to locate the extent of the gold deposits of South Africa. That is to make deep borings, in systematic fashion, at regular intervals, by means of the diamond drill. In South Africa, the depth of two or three thousand feet, and are the basis of what are known as the "deep level" mines.

It is not probable that any such deep borings will be made in the fields of Idaho and California, since for the most part the overlying lava has been eroded and scoured out so as to approach within some workable distance the gold-bearing lava. To locate deposits bare a large amount of capital will be required, and it will be necessary to conduct the prospecting upon a large scale. Under the most scientific methods as have been employed so successfully in South Africa. But it is to be noted that the revival of gold mining is due not so much to the diamond drill, as it is to the many great discoveries have been made on this continent, as to the wonderful cheapening and improvement of every detail of the mining process. Even within the last five years it is estimated that the cost of obtaining gold in many of the Western states has been cut in half.

Since the days of the famous Comstock lode, it has been cut down to a fourth or fifth of what it was. The introduction of the dynamite drill, of improved machinery, and of new and more perfect methods of extraction has made it possible to mine low grade ore at large profit which a few years ago would have been thrown away.

A WONDERFUL CHANGE.
This, the first of the great gold discoveries of the world, is the only gold mine, but of silver and copper mining as well. Thus, the Anacostia mine, in Montana, has produced in the past year more than \$1,000,000 worth of gold, silver and copper. It is nearly one-half all the gold of the world, and next year it is not unlikely that these sections will turn out above seventy millions. That is double the gold production of this area during any period since the Comstock days.
