Epidemic Probably Not Spanish in Origin—Greef Stuff Unlinked—Popu-
lace Danger Assumed Against “Spanish Influenza”—Government General Blue
Alerts Authoritative Statement.

WASHINGTON, D. C. — (Special)—Assur-
ance from the White House of the absence of the virus of the influenza ep-
lidemic which has been prevalent in many Spanish authorities rep[30p]orts is confirmed.

It is further stated that the present epidemic is no more widespread through the United States than it is in any of the European countries, and the disease called “American” influenza.

In response to a request for definite information by the Public Health Bul-
letin, Surgeon General Rupert Blue of the Public Health Service has authorized the following official inter-
pretation:

What is Spanish influenza? Is it another name for Spanish influenza?

The 1918–1919 epidemic is sometimes known as “Spanish influenza” because the first cases of the disease mentioned in the United States were in Spanish sailors on ships from Europe. The virus may have originated in Spain, but it is not known for certain. The name “Spanish influenza” is not used to describe the current flu virus.

Do coughs and sneezes spread disease?

Influenza is caused by a virus that is spread from person to person through droplets when an infected person coughs, sneezes, or speaks. The virus can also be spread by touching a surface with the virus and then touching your nose, mouth, or eyes.

What is the difference between the common cold and the flu?

The common cold and the flu are both viruses that cause similar symptoms, such as a cough, sneezing, nasal congestion, and sore throat. However, the flu is more severe than the common cold and can lead to serious complications, such as pneumonia, bacterial infections, and death. The flu also causes fever, while the common cold usually does not.

What is a pandemic?

A pandemic is an outbreak of a disease that occurs simultaneously in different parts of the world. Pandemics are usually caused by new strains of a virus that are easily transmitted from person to person. The 1918–1919 flu pandemic was one of the most severe in history, killing millions of people worldwide.

Most Horrible invention that ever was seen. In War.

It brings Years and Causes Painful Sickness to our Fighting Soldiers.

WASHINGTON.—The most dangerous of all the stages of the influenza epidemic is the later stage characterized by the greatest number of deaths and highest number of cases as the war moves on.

Mustard Gas is a distinctively different form of influenza, with symptoms that are more severe than the common cold or the flu. It is highly contagious and can be transmitted from person to person through the air, touching, or breathing.

Direct contact with the spiny cury causes blistering of the skin, and the vapor in the air penetrates the lungs. The results, in most cases, do not cause death.

The symptoms are similar to those of pneumonia or viral illness, but the course of the disease is much more severe. The disease may be transmitted from person to person through the air, touching, or breathing.

The mustard gas used in World War I is now being used as a tool of war in World War II, with devastating results.

Influenza can occur in any season, but it is more common during the fall and winter months. It is spread through droplets when a person coughs, sneezes, or speaks. The virus can also be spread by touching a surface with the virus and then touching your nose, mouth, or eyes.
