How to Protect Rare Bushes From Green and Pink Aphid

Washington, D. C., May 20.—When new growth starts on the rose bushes in the spring, and throughout the summer and fall, the young growth and the flower buds and stems of rose bushes are often covered with a small green or pinkish plant-louse, known as the rose aphid, which sucks the sap from the tender portion of the plant and causes an unhealthy curled condition of the foliage and disappointment in the number and quality of the flowers produced.

The rose aphid passes the winter in the egg stage on the stems and dormant buds of the rose bushes, according to A. D. Hopkins, forest entomologist, U. S. department of agriculture. The insects hatching from these eggs reach maturity in about 15 to 20 days, all being wingless. They are pear-shaped and either bright green or pinkish in color. At this stage they begin to produce living young, each individual in course of about 20 days producing 50 to 100 young, which, on maturity, are either winged or wingless and in turn either green or pinkish. Thus the tender growth soon becomes crowded with various sizes, colors, and shapes of aphids, and, to insure their progeny with an adequate food supply, the wingless mothers migrate to less crowded growth and the winged ones fly to other rose bushes each starting a colony for herself. In favorable weather conditions, especially in a humid atmosphere, many generations may thus follow one another, covering every bit of green vegetation on the bush with their bodies, their cast skins, honeydew, and the resulting sooty fungus. It can easily be seen that had every aphid produced in this course of a season lived its full life, the progeny of a single overwintering egg would run into millions.

The presence of ants on the rose bushes is an indication that the aphid is present, because the ants collect the honeydew from the aphides and, to a certain extent, protect the aphides from their insect enemies.

Natural Control
As above indicated, the rose aphid thrives best in cloudy, humid, warm atmosphere, hence with the appearance of a hot and dry spell they often disappear as suddenly as they appeared. Aside from a variety of causes, like driving rain, winds, etc., which decimate its numbers considerably, the rose aphid is attacked by other insects which either devour them as they develop from eggs deposited in their bodies, Ladybirds, lacewing flies, and the larvae of two-winged flies called syrphus flies are among the former and a number of species of tiny wasp-like insects represent the internal parasites. Some-

times the natural agencies of control are sufficient to keep the aphides so reduced in numbers that they do little or no harm. Notwithstanding the effectiveness of natural checks, however, their intermittent character, unfortunately renders their help often too late to save the flower crop. It is always advisable, therefore, to watch rose bushes for aphides and to apply remedies as soon as they are discovered.

Remedies
Fortunately the rose aphid readily succumb to artificial methods of control and, with the different styles of spray pumps on the market, there is no excuse for allowing roses to suffer from these insects. The simplest, most commonly used, and often quite effective remedy is to turn a fine but forceful stream of water on them by means of the garden hose. Applied often enough this gives satisfactory results. Solutions of fish oil or cheaper grades of soap are often useful as a prompt remedy. The soap is used at the rate of 1 pound to 4 gallons of water. To make the solution, shave the soap into the water, and dissolve by heating, adding enough water afterwards to make up for evaporation.

The best remedy for the rose aphid is 40 per cent nicotine sulphate (a liquid which can be purchased in most seed stores) diluted at the rate of 1 part to 1,000 to 2,000 parts of water, with fish oil soap or laundry soap added at the rate of 1 pound to 50 gallons of the spray mixture. The simplest way to prepare the spray in small quantities and secure satisfactory proportions of the ingredients is to put 1 teaspoonful of the nicotine sulphate in from 1 to 2 gallons of water and then add one-half ounce of laundry soap. One spraying is usually 100 per cent effective, but if the first application has not been thoroughly made, a second one may be necessary.

In order to prevent the possible development of mildew as a result of frequent spraying it is advisable to make the applications in the early morning so that the spray will dry off the plants promptly. The spraying device to use depends on the amount of spraying necessary. A cheap atomizer, such as can be bought in any seed store, is quite satisfactory for small plants and gardens. Good knapsack and barrel pumps are available for commercial growers.

Notice of Improvement of Fairgrounds Road
Notice is hereby given that the common council deems it expedient so to do, and hereby declares its purpose and intention to improve Fairgrounds Road between the west line of Sumner street and the west line of the Oregon & California Railway company's right-of-way at the expense of the abutting and adjacent property, by grading, curbing, and paving said portion of said street with a five-inch two-course Bituminous Concrete pavement, consisting of a one and one-half inch Bituminous Concrete wearing surface laid on a three and one-half inch Bituminous Concrete base in accordance with the plans, specifications and estimates for the improvement of Fairgrounds Road between the west line of Sumner street and the west line of the Oregon & California Railway company's right-of-way, adopted by the common council on the 1st day of May, 1916, and now on file in the office of the city recorder, which for greater certainty and convenience are hereby referred to and made a part of this notice; being that character or kind of improvement known and designated in said plans, specifications and estimates as "Bituminous Concrete Pavement No. 1."

The common council hereby declares its purpose and intention to make the said above described improvement by and through the street improvement department of the city. By order of the common council. CHAS. F. ELLIN, City Recorder. Dated this 17th day of May, 1916. May 29.

WANTED—A good stock farm. We have to offer in payment first mortgage of \$4500 on well improved farm and a good city property worth \$1,800. Square Deal Realty Co., 292 U. S. Bank Bldg. Phone 470. tf

Forests of Crater Lake National Park

The heavy mantle of beautiful coniferous forests in Crater Lake National Park is second only to Crater Lake itself in attractiveness according to a publication by J. F. Penot, entitled "Forests of Crater Lake National Park," just issued by the Department of the Interior. "Within the confines of the park," says Mr. Penot, "are more than a dozen cone-bearing species—pines, firs, hemlock, and others—growing in pure bodies or mingled together forming a confused broken cover. The various trees of the southern Cascades are not generally scattered throughout the mountains, but are distributed in fairly well-defined zones at different altitudes." In this publication, which may be purchased from the Superintendent of Documents, Government Printing office, Washington, D. C., for 20 cents, are descriptions of the principal species and illustrations showing characteristic types of each tree. Over all of the region excepting the summits of the highest peaks, is spread a wonderful array of evergreen trees, clothing the slopes with dense solemn forests or dotted around mountain meadows, canyons, and crater rim.

The traveler who makes only a fleeting trip to the park, sees the lake but once, and then passes on will overlook much of the best that the region can show. It is better to remain longer within the borders, to camp beneath its hemlocks and firs, to explore its peaks and forests, and look often and long upon its lake, whose blue waters and wondrous trees and cliff setting leave memories that can never be lost.

Coos County Breeders Buy Polk County Stock
Polk county enjoys the distinction of having furnished Coos county the foundation for the betterment of its Jersey herds, seven registered bulls from here having been shipped thither last week. This is unquestionably the largest bull shipment ever made from Polk county, and came as the direct result of the cow testing idea as worked out by J. L. Smith, county agriculturist of Coos county. Six breeders of the Coos testing association, having decided to improve their herds through the importations of bulls requested Mr. Smith to put them in touch with stock of recognized merit, and he in turn took the matter up with W. A. Barr, field chairman for the Agricultural college, who recommended the Jersey bulls of Polk county breeders. Three of the bulls were Luckinmate Jewel Noble, the first bull calf from Noble's Empress, that won first honors as a two-year-old at the Panama-Pacific International exposition; Luckinmate Ideal Boy, whose full sister has just finished with 1,006 pound butter as a two-year-old, and Luckinmate Bachelor, from Frank Loughery's farm, Monmouth. Two of the bulls were from G. G. Hewitt's herd at Monmouth, and the sixth was from W. L. Hull, Ballant.

The plan worked out by Mr. Smith gives the breeder a fair price for high class stock, and at the same time makes the deal a most economical one for the Coos buyers. The buyers got a large number and, in consideration of this, the freight was prepaid and a lower price quoted on the animals. Safe to say \$200 was saved through the wholesale purchase. They bought unrelated bulls, and it is their intention to exchange every two years, and thus each member of the bull club gets a change in the head of his herd biennially for 12 years, and yet has only bought one bull.

The chief purpose of the association is to promote interest in the Jersey breed in Coos county by the exclusive use of registered Jersey bulls and by grading up their herds by testing the offspring from such sires and to co-operate in the buying and selling of stock. Any dairyman in that county may become a member by sending in his name, the name and registered number of his bull and the membership fee of \$1 to the secretary. There are over 200 purebred Jersey bulls in Coos county, and quite a number of purebred Holstein bulls.—Dallas Observer.

THE PURSUER IS PURSUED
It may be genuine sport to track a bear, but when a hunter is tracked by a bear much larger than the one he is tracking, and doesn't know it until it is over, it doesn't seem like real sport. That is exactly what happened to S. B. Taylor, city engineer of Dallas a

few days since, when he was returning from a trip some miles up the river from Black Rock, where he had been doing some surveying for the Willamette Valley Lumber company. Mr. Taylor had completed his work and started for camp, when he saw a bear's track in the trail. Having his revolver with him he decided to trail Mr. Bruin. For several miles he followed him, until finally the bear turned into the deep forest. The pursuer then pocketed his revolver and continued his way.

George Morton, Art Hayes, Harry Byers and N. Sears had occasion the next day to visit the same part of the country. They had heard Mr. Taylor's story, and they decided to verify it. They were astonished, Mr. Taylor was wrong. The bear had done the tracking, it appeared, and Mr. Taylor had been the pursued, but that wasn't correct. There had been two bears. Mr. Taylor had trailed one—

the smaller one—while the larger bruiser had trailed Mr. Taylor. It was evident that one animal had been following the other through the country, and it appeared that Mr. Taylor had lobbied up between the two. The engineer is going to give all bear tracks a wide berth hereafter.—Dallas Observer.

BUILDING AT SILVERTON
Henry Grainger and Arthur Chamness secured the contract Tuesday for the erection of a new residence for J. L. Stalker on Mill street. The house will have six rooms, with bath, toilet, pantry and full basement. The first work to be done is the moving of the present house to the rear of the lot, where it will be remodeled and rented. Work on the new house will be started in about 10 days.—Appeal.
