Voyageurs Pick Up Semiprecious Stones
On California Beach

RECORDS show that only a few hundred people have ever had a chance to see the unique and beautiful semiprecious stones that lie abundantly along the shores of the Channel Islands. The rocks are not easily accessible to the public because of the inhospitable nature of the Channel Islands, and because of the fact that they lie beyond the immediate reach of the continental shelf.

On a recent trip to the Channel Islands, the author was able to obtain a number of these stones, which he believes will make excellent additions to any mineral collection. The stones are composed of various minerals, including feldspar, quartz, and mica. They are usually found in clusters, and range in size from small pebbles to large boulders. The author believes that these stones will be of great interest to mineral collectors, and hopes to make them available for sale in the near future.

Photographic Notes

Designed for publication, sales, and commercial photography, a new line of cameras has been offered by The Kodak Company of Rochester, N. Y. This line of cameras is designed for use in the field, and is suitable for both amateur and professional photographers. The cameras are equipped with a variety of features, including a wide choice of lenses, a built-in light meter, and a variety of exposure controls. The author believes that these cameras will be of great value to photographers who want to take high-quality pictures in the field, and hopes to use them extensively in his own work.
