FARM POULTRY

渺 perhaps the most important events of the season for the poultry fancier is the annual spring show and sale of stock. It is estimated that the present production of poultry in the United States is over 4,000 million birds. While this figure is undoubtedly much too high, it is also estimated that the total number of birds produced in the United States is between 2,000 and 3,000 million.

In connection with these events, we have been able to secure some interesting information. For example, it has been found that chickens are particularly well adapted to the conditions of the United States. They are hardy, quick-tempered, and easily managed. Moreover, their eggs are of superior quality and are in great demand.

In connection with the sale of stock, it is interesting to note that the majority of the birds are sold at a very young age. This is largely due to the fact that the poultry industry is primarily a highly specialized one. The majority of the birds are sold to dealers who subsequently sell them to fanciers, or to farmers who raise them for egg production.

As regards the quality of the birds, it is interesting to note that the majority of the birds are of the so-called "pure-bred" type. This is largely due to the fact that the pure-bred strains are more resistant to disease and are generally more productive. Moreover, they provide a more uniform output, which is particularly desirable for commercial purposes.

In conclusion, we wish to emphasize the importance of these events to the poultry fancier. They provide an excellent opportunity to see the latest developments in the industry and to purchase birds of superior quality. Moreover, they provide a source of information and advice on all phases of poultry production.
