Congress of the American Whist  
League, July 5th to 10th. The Chicago  
Great Western Railway will take you  
there for fare and one-third on the  
certificate plan.

# War Beneath the Seas

A Submarine Boat Destroyer of Fearful Power to Be Built  
by the Russian Government.

Special to the Globe.

VLAIVODVOSTOK, June 26.—The Russian  
government is about to build a  
submarine boat destroyer which will  
be the first craft of its kind ever con-  
structed. It is the invention of a Russian  
marine architect, and this secret  
of his brain is guarded by the czar's  
officials as a miser hoards his gold. The  
czar feels now that he has a craft  
which will place the submarine boats  
of the United States and French govern-  
ments at his mercy. It is at these  
boats that the new invention is aimed.

In the first place, the submarine torpe-  
do boats of the navies mentioned  
have been looked upon with some-  
thing approaching awe by naval offi-  
cers everywhere. There has seemed  
to be something uncanny about them,  
darting about under the surface of  
the waves, and apparently the great  
warships of the world's navies were  
practically helpless against the attacks  
of these artificial marine monsters. The

land. It can be maneuvered up to  
1,000 pounds buoyancy, but not much  
above that.

When in motion, vertical rudders will  
effect the lateral direction of the craft.  
On each side of the center line, and  
forward of the propeller, are two hori-  
zontal rudders. These rudders are  
pivoted and regulate the depth of the  
vessel and divide it into compartments.  
It is desired that the vessel shall dive,  
the rear edges of the rudders are pushed  
downward. This causes the stern  
to move upward and the bow down-  
ward and the diving follows. To ob-  
tain a reverse motion, the action should  
be reversed.

It is possible to use the gasoline en-  
gine in the water, but it is not con-  
sidered advisable, because the air supply  
of the interior of the boat is limited.

The oxygen apparatus is the only source  
of power for the air resulting from the  
combustion of gasoline is a great  
loss, and the oxygen supply of the

vessel is to be used.

The task of locating a submarine  
torpedo boat which the offloors of the  
proposed destroyer will have to face,  
seems as difficult as that of locating  
the proverbial needle in the haystack.

Science, however, has contributed its

part.

It is believed that the gasoline en-  
gine in the water, but it is not con-  
sidered advisable, because the air supply  
of the interior of the boat is limited.
