Dairymen May Invade Red Meat Market

DAIRYMEN IN MONTANA may soon be invading the red meat market which is traditionally a stronghold of the beef cattle industry.

The production of meat for the American family table has been the province of farmers and ranchers whose business it is to raise beef cattle, hogs and lambs. It is true that cull cows from dairy herds, a limited number of dairy type steers and veal from surplus dairy calves have made up a small portion of the red meat trade. The glamour of a beef or lamb feed lot has always been much more tempting than a side-line in the dairy industry.

Times are changing and the housewife today is buying RED MEAT. Surplus fat on choice and prime beef has no sale value and the vast quantities of trim that are discarded by the butcher and the packer represent a tremendous waste in the processing of meat.

This fat costs money to put on the cattle in the first place and dietitians claim it is not healthy in the second place and the ultimate consumer just doesn't want to buy it. For years it has been maintained that in order to have flavor and tenderness good meat must be marbled with fat. This may not be so.

Breeding for Meat

Beef producers in their breeding programs today are paying much more attention to the ability of an animal to convert feed into red meat than ever before. Gobs of surplus fat are definitely undesirable on a finished carcass. The area of the rib eye and the number of pounds of red meat that can be placed on the scale and sold to the consumer is the final test of the value of a carcass.

It is impossible for even the best livestock judge to determine accurately the carcass value of an animal while it is still alive. Contention on this question has been prevalent for years. Much discussion has been had and volumes have been written on the subject.

Dairymen as a group have been strong believers in some kind of a testing program which would measure the ability of cows to produce and of sires to transmit high production capabilities to their offspring. Beef men are now starting to think along similar lines and are seeking ways to measure production capacity of beef herds.

Supplementary Income

All dairy farms, mine included, need a source of supplemental income. The answer to this problem may be found in a feed lot designed to produce good quality red meat from dairy bulls.

A leading farm magazine recently reported the experiences of a couple of Indiana farmers who have made a special business of making beef out of dairy bulls. They report gains of 2 to 3 pounds per day and feed costs per pound of gain were very favorable.

It has been found in many tests that bulls will gain faster and more economically than steers. Many tests have also shown that the quality of beef from young bulls that have not
