Concrete is a new form of the cement which has been used in the construction of recent buildings. It is a mixture of cement, sand, gravel, and water, and is used in the form of blocks or slabs. The blocks are manufactured in a variety of shapes and sizes, and are used in the construction of foundations, walls, and floors. The slabs are used in the construction of streets and sidewalks. The concrete is mixed in a machine called a concrete mixer, and is then poured into molds. The molds are then removed, and the concrete is allowed to harden. Concrete is a strong and durable material, and is used in the construction of many different types of buildings. It is also used in the construction of roads and bridges.
