## THE BULLET OR THE HOLE?

Which Gets Through the Board First?

When a bullet is shot entirely through a board, which gets through first—the bullet or the hole the bullet makes? The hole and the extreme point of the bullet get through the board at the same time, but the bullet does not get entirely through the board until after the hole is entirely through. It is evident that the rear of the bullet must be out of the hole it makes before it is entirely through the board, while the hole is entirely through just as soon as the widest part of the bullet has passed through.

How cold is it when it is twice as cold as 2 degrees above zero? There are two zeros, one marked 0 on the thermometer, and one known as absolute zero, which is understood to mark the absence of all heat. The zero of Fahrenheit's thermometer is obtained by immersing a tube of mercury in a mixture of snow and common salt and marking the place where the mercury stands in the tube. Absolute zero is 459 degrees below this zero. Now, "twice as cold" is exactly equivalent to half as hot; therefore, when it is half as hot as 2 degrees above zero, or 44 F., it is 230.5 degrees below the zero on the thermometer.

Is any man strong enough to break an egg held end to end between the palms of his hands? The force required to break an egg in this manner has been found to be between seventy-five and eighty pounds. A great many men can exert this pressure. The probable reason for the failure of many to accomplish it is that they are a little afraid of the result and do not press as hard as they can.

If there was a tunnel through the center of the earth and an iron ball was dropped into it, where would the ball come to rest? Unless it was retarded by the resistance of the air, the ball would go through to the other side and then fly back to its starting point, repeating its operation forever. If retarded by the resistance of the air, it would ultimately come to rest at the center of the earth.

When an automobile turns a sharp corner at a rapid rate of speed, which pair of wheels, inside or outside, leaves the ground? The centrifugal force developed by the automobile is directed outward; therefore it is impossible for it to tip inward. The outside rail of a railroad track on a curve is made higher than the inside rail because of the tendency of the train to tip outward. A practical demonstration may be had by standing on the rear platform of a street car and noting which way the body is thrown when the car turns a curve.

A chicken does not eat anything during the first twenty-four hours of its existence, yet it doubles in size. What does it live on? The amount of the egg left in the chicken's stomach after it is hatched will supply nutriment for several days. As to the apparent increase in size, when the organs are relieved from the compression of the eggshell they expand; therefore the chick appears larger. The down becomes fluffier when dry, and this also increases the size of the chicken, but it is not a fact that there is any great change in the weight during the first day.

Why does an egg weigh more after it has been boiled than before? The increase in weight is due to the moisture which has been absorbed by the porous shell of the egg.—Sunday Magazine.

## A Member For Cork.

A famous character in London when Fraser's Magazine was in its heyday was Sergeant Murphy, member of parliament for Cork. The sergeant was one day at dinner with Samuel Warren, author of "Ten Thousand a Year," and one of the most convicted authors of his own or any other time. This novel was then appearing in Fraser's in serial form. Warren, who was always fishing for compliments, said to Murphy across the table, "Have you read that thing that is coming out in Fraser's?" "What thing?" said Murphy. "Ten Thousand a Year," replied Warren. "Yes, I have read it," admitted the sergeant. "What do you think of it?" continued the novelist. "Hardly fair to ask me," said Murphy. "Considering I wrote it myself."

Another acquaintance of Murphy's was constantly afflicted by itching of his aristocratic friends. At a dinner party where there were several Roman Catholics present, conversation centered around the subject of fasting, when the sergeant's friend struck in: "It is very strange how little the high-society people regard fast days. I was dining at the house of Norfolk's on a fast day three weeks ago, and there was not a bit of fasty at dinner." "I suppose," said Murphy in the midst of the deep silence that followed, "that they had eaten B. all in the dining room."—London Tribune.

## Charlotte Bronte's Writing.

It is generally believed that "Jane Eyre" was written by Charlotte Bronte on the backs of old envelopes or very small scraps of paper, which the author carefully pinned together and numbered. Miss Bronte wrote so small a hand that some of her manuscripts can only be read by the aid of a magnifying glass. It is declared that on a piece of paper no larger than a playing card she would write from 100 to 200 words, and after that would insert so many corrections that the printer found it well nigh impossible to set it up. When she wrote "Jane Eyre" Miss Bronte had read few novels but those by Thackeray, whom she greatly admired. Thackeray complimented the author on her great book, but complained that the plot was familiar to him, whereupon Miss Bronte modestly replied that she thought it was original, inasmuch as she had read so little.

## REAL ESTATE TRANSFERS.

Compiled by the Guaranty Abstract Company of Pauls Valley.

Arthur J. Cline to Tom Grant, E. 1/2 of SW 1/4 of SE 1/4, section 34, T1N R1 E1. Consideration \$365.

A. B. Stokes to E. Threlkeld, lot 2, block 137, Wynnewood. Consideration \$265.

E. H. Secrest to W. D. Covington, lot 3, block 130, Wynnewood. Consideration \$500.

E. Threlkeld to W. D. Covington, lot 2, block 137, Wynnewood. Consideration \$300.

Foley's Honey and Tar cures the most obstinate coughs and expels the cold from the system as it is mildly laxative. It is guaranteed. Do not risk taking any but the genuine in the yellow package. Hoffman Drug Co. and City Drug Store.

## Sam Jones in Oklahoma.

Ardmoreite Special.

Oklahoma City, Oct. 1.—The Rev. Sam Jones will make a tour of Oklahoma this week in behalf of the anti-alcohol league, which is making strenuous efforts to get a prohibition platform in the constitution of the new state. The temperance organizations of all the counties are waging active campaigns.

## THE PEOPLE OF PARIS.

Their First Movements in Revolutions Are Usually Generous.

I know the men of the people in Paris too well not to know that their first movements in times of revolution are usually generous and that they are best pleased to spend the days immediately following their triumph in boasting of their victory, laying down the law and playing at being great men. During that time it generally happens that some government or other is set up, the police return to their posts and the judge to his bench, and when at last our great men consent to step down to the better known and more vulgar ground of petty and malicious human passions they are no longer able to do so and are reduced to live simply like honest men. Besides, we have spent so many years in insurrections that there has arisen among us a kind of morality peculiar to times of disorder and a special code for days of rebellion. According to these exceptional laws, murder is tolerated and have permitted, but theft is strenuously forbidden, although this, whatever one may say, does not prevent a good deal of robbery from occurring upon those days for the simple reason that society in a state of rebellion cannot be different from that at any other time, and it will always contain a number of rascals who as far as they are concerned scorn the morality of the main body and despite its point of honor when they are unobserved.—"Reflections of De Toqueville."

## TIDAL FLUX AND REFLEX.

Complicated Movements of the Billows of the Oceans.

Those who see the rise and fall of the tides in our Atlantic harbors seldom think of the wonderful course of the ocean waves which cause the tidal flux and reflex. Such billows not only cross the sea, but flow from ocean to ocean, and in this way complicated movements are set going.

Thus, for instance, once in every twelve hours the moon raises a tide billow in the southern Indian ocean. When this billow passes the Cape of Good Hope at noon its successor is already born, and by the time the first billow has reached the Azores islands at midnight the second is rounding the cape, and a third has come into existence in the southern ocean. By 4 o'clock in the morning following its passage of the cape the tide billow reaches the English channel, and there the shallow waters delay it so much that it does not arrive at the strait of Dover until 10 a. m. Here the narrowing channel causes the tide to rise very high and almost puts an end to the wave.

In the meantime another branch of the billow runs around the western side of the British islands, rounds the north point of Scotland and moves slowly down the eastern coast of England until it finally flows up the Thames and laps the wharves of London.—Philadelphia Record.

## The Palisades.

This uplift of volcanic matter, resting on baked sandstone and inclining westward at a gentle slope, presents in its riverward aspect the columnar or palisaded appearance that so impressed the early voyagers—a gray wall befitting from 300 to 500 feet above the tide, shagged with trees at the summit, half buried behind a scrap of talus, that is also verdurous. At Nyack it bends into the amphitheater where that pretty town has nestled, surges riverward again to form Point-n-Point and, still ascending behind Haverstraw, reaches in High Tor a lift of 820 feet. As the dike extends southward also to Bayonne, its total length is forty miles, but the Palisades proper from the river for half that distance.—Charles M. Skinner in Century.

Chickasaw students can secure a six months' scholarship in all departments of Selvidge Business College, together with books and board, for \$40. The Federal Government pays the balance.
