Hints to Farmers

Hogs need to be fed often.

A special bee cellar is desirable.

Manure spreaders are all right if used enough.

Bees winter poorly on honey dew, fruit juices or cider.

It's a sure sign that a horse's teeth need looking after if he voids whole grain.

Incubator chicks are never infested with vermin when the are hatched.

Slow decay is just what proves best for a supply of potash, phosphorus and lime for the trees.

"Limberneck," in chickens, is caused by the absorption of a poison found in decayed animal food.

Sorghum, cut and cured when the heads are slightly brown and the seed in dough, makes a fair winter feed.

As to the best time to market young stock, it is, as a general proposition, when they are in a finished market condition.

A handful of oil meal given to the horse once a day will keep him in good condition and makes his coat soft and sleek.

Ten cows that average 300 pounds of butter fat per year produce as much as 20 cows that average only 150 pounds per year.

Oil meal is being shipped by the carload to Europe, where it is fed by dairymen. It would be to our advantage if this were fed at home.

A man should have a good strong hand and he should know how to use it in order to get the milk out of the udder and get it out rapidly.

Chopped onions are very good for all kinds of poultry. Onions are not only invigorating, but are excellent when the fowls are subject to colds.

The precaution against possible danger, where work is pressing and farmers want to get their corn in out of the way, is ventilation of the crib.

Onions must be kept in a dry, clean place, although protection from cold is not so necessary. In fact, freezing, with moderate thawing out, makes the flavor milder.

A pail of milk standing ten minutes where it is exposed to the scent of a strong-smelling stable, or any other offensive odor, will imbibe a taint that will not leave it.

Well fattened young stock always sells at a good price, and it is generally better to let the condition of the animal rather than that of the market determine the date of selling.

With good milking cows, well fed and well kept, milk can be produced at a cost of 65 cents per hundred and butterfat for 16 cents per pound. This is an average for the year round.

If some of the brooder chicks are not quite so thrifty as the others they should be put by themselves if possible, where the stronger ones will not run over them and rob them of their feed.

There is so much difference in the composition of milk from different cows that many large butter and cheese factories now test all the milk they buy, and pay for it according to its butterfat content.

The automobile has not spoiled the horse market nor has the incubator spoiled the demand for Biddy. One Nebraska firm alone reports the sale of 38,000 incubators the past season, yet hens are higher than ever.

While our hardiest varieties of roses may endure the evaporation of our trying winters, they will, however, come through stronger and give better results the coming season if they can receive a fair measure of protection during the winter.

Scraping old apple trees to remove loose bark is a good practice when combined with judicious pruning. It makes the trees look better and do better and it reduces the number of insect hiding places. Once in three to five years is often enough to do it.

Remember that the man who picks up his birds, throws them into a crate and ships them off to a show rarely gets a prize. It requires careful selection and careful previous preparation to put a bird in the best possible condition and the man who wins is the man who has thought of this.

That dried beet pulp is a better feed for dairy cows than corn silage was demonstrated by the New Jersey experiment station. It found that cows fed on beet pulp produced 10 per cent. more milk than when fed on a corn silage ration and four per cent. more milk than on a hominy ration.

The legumes draw nitrogen from the air and store it in the soil for the succeeding crop, thus making good the loss of this element through the previous crop grown. These means are at the command of every man who cultivates the soil and if he will avail himself of their good offices he may view his crops with much pleasure and great profit.

RECORD LANGUAGE ON PHONE

Copenhagen Company Invents Way Hello Girls Can Get Even with Exasperated Men.

Copenhagen.—Exasperated telephone subscribers who, unable to get connections as quickly as they would like, indulge in harsh language towards the girl clerks, have been cleverly brought to book by the telephone administration.

At first it was found difficult to identify the offenders, so a gramaphone apparatus was installed at the central exchange. The moment a subscriber began to use unseemly language, the girl would have it recorded by the gramophone.

Some of the worst offenders were summoned to the directors' office, and when they denied their hasty remarks, they were convicted by an exact repetition in their own voice on the gramophone. Telephone manners in Copenhagen have, as a result, greatly improved.

Cosmetics in Demand.

London.—Is the complexion for which the English woman has long been celebrated coming to grief?

An investigation leads to the conclusion that the modern Englishwoman resorts more frequently to cosmetics, the need for which is attributed to woman's increasing work in the world and the nerve strain produced by duties to which her grandmother was a stranger.
