## A TENDENCY OF THE TIME.

The Work of Psychical Research and What It is Likely to Accomplish. It is at first glance remarkable that so skeptical an age as ours should be the time in which so thorough and extensive research is made into that misty region which of old was regarded as the supernatural, but which is now the custom to look upon as merely the un-explored; and yet upon the second thought it is apparent that it is pre-cisely the skeptical age that is most likely to study this phase of nature. In a more devout age it would be thought that there was something half sacri-legious in prying into the hidden mysteries of creation; while in a more su-perstitious age a more or less conscious fear would do much to check investigation. It is in the calm and coolly investigating temper of the generation which is still in doubt that these things

are sure to be most eagerly studied.

There is, of course, the widest difference of temper in the minds of those who in one form or another have thrown themselves into psychical research. It was said, with perhaps more epigrammatic neatness than accuracy, that the English Society of Psychical Research was established to prove that all ghost stories were true, while the American was established to prove that all were false; yet with whatever extravagance of statement there was at least a grain of truth in the phrase. The negative is never of a vitality equal to that of the positive, and in the end the American society went under, and its remnants have been annexed to the English body. That there are ear-nest workers in both is doubtless true, and it is no doubt true also that there is much work of value done by the society. Certainly many of the men connected with the movement would com-ment mand respect for any enterprise in which they were engaged or to which they lent their support.

The thing which strikes an outsider, however, is the fact that it is the almost invariable result of the following sort of study that the student is drawn from the real to the unreal, from the tan ible to the intangible, and—alas, the it must be added!—from the tenable to the untenable. The history of the vast ma-jority of thinkers who have plunged injority of thinkers who have plunged in-to this sort of study has been that they have ended by being the dupe of illu-sions which they would have been the first to smile at when they were in a sane and normal condition, illusions of which the falsity has been demonstrat-ed beyond peradventure. It has not in-frequently happened that investigators for the power and clearness of for the power and clearness of whose mind at the outset, for whose fairness and integrity there could not be too much admiration, have in the end become the victims of the most vulgar trickery, the dupes of charlatans who had not the merit of extraordinary cleverness to recommend them, or the champions of vagaries begot in their own brains like maggots in sunbaked

The value of psychical research is too obvious to need remark, and it in no obvious to need remark, and it is in no spirit of cavil that this common tanger of the study is touched upon. Why is it that investigators so often lose their balance in this field it is not easy to say, but of the fact, at least, there seems to be no reasonable doubt. Whether it be from the habit of mind induced by too much striving after the intangible, whether it be that the powers proper to the perception of this branch of investigation be not well developed in the race as yet, whether it be that contact with the class or phenomena dwelt upon in these the mind, it is impossible to say; it is only possible to predict with approximate assurance that the man who goes will in nine cases out of ten come to the place where he will be a possible if not a probable victim to the easiest and most transparent frauds of circumstances or of charlatans. He will come to the place where it is inevitable that he should either be tricked or trick him-

It is possible that this is one of the phases through which this branch of science must go, and from which it will

triumphantly emerge later. It may be that it is merely the natural result of hereditary tendencies, and that in a generation or two the impulse, brought constantly in contact with the hard face of fact, will be worn away. In the meantime it is not unnatural that the human mind, being called upon to be-lieve scientifically so much that it has hitherto held to or rejected as belonging to the realm of the supernatural, should find it difficult to distinguish be-tween the true and the false. This may come later when the atmosphere of investigation becomes cleared from the lingering mist of old superstitions. Meanwhile there is nothing to do but to push the investigations; although the outside world must look upon whoever goes deeply into this branch of study as a man who is likely to make a sacrifice of himself in the cause of science much in the same way as a man sacrifices him self who goes into a mine full of poisonous vapors for the sake of bringing back to light such gems as may chance to be mixed with the handfuls of pebbles which he gathers in the desperate haste that haply he may escape with his life.—Boston Courier.

### MAKING UP.

Some of the Secrets of My Lady's Toilet Chamber Revealed.

The idea of "making up" is extremely distasteful and suggestive of the ballet to the woman of refined taste, and yet such is the delicacy of coloring in most American faces that in the blaze of brilliant lights their beauty seems faded, or is lost altogether. Particularly is this noticeable in boxes at the theater or opera, where the glare of the footlights increases the pallor of delicate women and dims the coloring even of the freshest and fairest youth-

The great beauties of bygone ages owed much of their triump to the se-erets of the toilet) but, unfortunately, so jealously were these secrets guarded that they were burked with their owners. But since it is every woman's bounden duty and privilege to make the best of the beauty which she possesses, whether the Creator has endowed her with a greater or lesser share of charms, a little chapter on the "makeup" for ladies may interest some fair reader.

Some one wise in the arts suggests that the appearance of the neck and arms is always most pleasing in evening dress when they have been sponged with perfumed tepid water, thoroughly dried, and then bathed with a lotion composed of equal parts of glycerine and rose water. While this is still damp a thick coating of powder is ap-plied with a puff and left on until the last moment. If it is then rubbed in thoroughly, but gently, the skin will seem beautifully white and all-traces of powder will have disappeared.

The scarlet tint of the lips is intensified by wetting them with perfume, and, when that has dried, touching them with cold cream to soften them. This treatment should not be applied very often, as the delicate membrane of the

lips may become hard and dry.

Powder on the face shows less if applied with a bit of chamois rather than a puff, or if a puff is used the powder should be rubbed gently into the skin with a hare's foot or a small, soft brush, such as is used on babies' heads.

Eyebrows are wonderfully improved by rubbing good brilliantine into them, and then coaxing or training them into proper curves with a fine-tooth comb or the fingers. The brilliantine does away with the need of the actor's pencil, as it darkens the hair.

There was once a famous lady who tinted her cheeks with mashed strawberries washed off with milk, but the inexpensive and easily obtained garder beet will give the cheek as fair and natural a bloom, and can in no sense be construed as rouge or paint. Just why it is so much more shocking to use a bit of color on the cheeks than any amount of powder on the face and arms and shoulders is a bit difficult to compre-hend, but such seems to be the prevalent opinion among conservative women. The homely vegetable is simp-ly cut with a knife and left to drain its juice out for beauty's use. The liquid should be applied with a camel's hair brush and toned down after it dries with a coating of powder. But the women who uses it must have such artistic inspirations and nicety of execu-tion that even her most intimate friends will never imagine that she is "made up," or the whole process will result in disastrous failure.—N. Y. Sun.

### PROPERTIES OF ALUMINUM.

It Is One Seventh the Weight of Gold and

To the laymen a few statistics about aluminum may be instructive. The atomic weight is 27.4. With iron three the melting point to such a liquid state that it can be run into the finest interstices of the mold and produce the finest castings and consider ably improve the quality of the iron. With copper aluminum very easily amalgamates, improving the quality, amargamates, improving the quality, appearance and strength, and resembles gold. Useful results are obtained with about five per cent. Aluminum also amalgamates with many other metals, and this is a boundless track for experi-

Aluminum is sonorous, and doubtless when alloyed with other metals would produce as good an effect as now can be produced from the finest bell metal. Its lightness in this respect would be of advantage for high elevations. The specific gravity of the metal is 2.55. It is about one-seventh the weight of gold, about one-fifth the weight of lead, and, roughly speaking, about one-third the weight of copper, zinc or iron. The melting point of aluminum is about 1,500 degrees Fahrenheit, while that of iron is almost double the tempera

The electrical conductivity is stated to be eight times that of iron. Its elasticity may be taken to be equal to silver. It is non-soluble in sulphuric acid, which acid, produced from coal combustion, is so destructible to iron, zinc and marble. It can be beaten into plates as thin as tissue paper and drawn out into wire as attenuated as the fines silk. It does not oxidize like iron, consequently does not rust, and requires no pains or protection from the influof the atmosphere.—Iron and Steel Trades' Journal.
